So before buying expensive hardware add-ons, check out if your MSTE can handle a HD drive. The floppy controller, a WD 1772 02-02, gets a little warmer, but it works !

Bye,

Walter

Hmm, I can see why pure fighters couldn't make it, but I can't think why pure magic users couldn't. Any chance of spilling the beans 8-)

On the subject of Dungeon master, was it actually possible to kill the Dark Lord by combat? I know they'd put an ending in where the white lord wiped you out if you'd killed the dark lord, but was that for real?

What you should consider is what you intend to use the MAC for. If it will be a stand-alone system then Spectre could be very usable to you. If you will need to join a local-talk network then Spectre will be of very little use with-out Dave Smalls Mega-talk board, which only fits into MegaSTs. I use Spectre 128, not GCR and it fits my needs.

With Spectre you can setup your system to become a MAC on boot-up so their is very little difference in that regard. The only really noticeable difference I've found is the way Disk inserts/ejects take place.

Spectre works fine with AdSpeed-ST, though if your system has 2.5meg of memory you have to do some extra key-strokes, which I think is needed for ALL STs.

Nobody answered?!? Sheesh! We all must've been in a flame war or
something... ;-)

> So what ? I stick to GFA Basic for writing games and only use
> C for writing programs with no (or little) graphics

IMHO, GFA BASIC is nasty and hellishly incompatible... Hopefully I
won't start another flame war by saying that.

> For people who don't know what GET and PUT are:
> GET x1,y1,x2,y2,CH$
> copy the screen portion given by x1,x2,y1,y2 into the string CH$
> PUT x,y,CH$
> copy back the screen portion in CH$ as a rectangle with x,y being
> the upper left point coordinates.

Have you done any VDI programming? It needs a little bit of setting up,
but not too much. And it'll generally work in any resolution...

vro_cpyfm() is the function you're after:

Copy Raster, Opaque

```
int vid_handle, mode, points[8];
struct fdbstr
{
int *fd_addr; /* ptr to image data area [just a buffer] */
int fd_w; /* width in pixels */
int fd_h; /* height in pixels */
int fd_wdwidth; /* image width in words (ie, 16-bits) */
int fd_stand; /* standard format or ST format flag */
int fd_nplanes; /* number of colour bit planes */
int fd_r1, fd_r2, /* reserved for future use */
fd_r3;
} src, dst;

vro_cpyfm( vdi_handle, mode, points, &src, &dst );
```

For more info, grab a VDI book, or beg someone for sample code... ;-)
I'd type the rest of the manual page, but it's quite long. Useful mode
values are 3 (replace dst with src), 6 (XOR dst with src).

From: lenn@mentor.cc.purdue.edu
Message-ID: <C1F5JL.4H@mentor.cc.purdue.edu>
Source record: 211431

I am looking for a used 1040STe, with TOS 1.62 or 2.06.

I will consider any RAM configuration.
I only want the computer and mouse and the owner's manual.
I will pay a very fair price.
Obviously, the computer should be in perfect working order.

I will consider STe's with other upgrades such as AdSpeed etc.
and will pay accordingly for the upgrade's value.

Thanks in Advance,
Jody Lenn

Well, there was that LAW SUIT they filed (unsuccessfully) against Nintendo
a while back...

Oh, and the Lynx is competing with the GameBoy; competition seems to be
stepping-on-our-toes to Nintendo.

But are you going to be running a text editor in 16 bit colour? Personally I'd be happy with a high resolution 16 color display for most of my work (hopefully one of the same quality I get on my SM124), and the higher colour modes for games/art work.

Spectre GCR from Gadgets by Small plus a set of Mac ROMS will cost you about $500,
which will effectively turn your ST into a Mac-Plus (mono--no color options yet).
It currently runs System 6.0.5 pretty good--no system 7. And almost all the Mac software
I've tried (besides a few games) has worked flawlessly. It's very
transparent to the user, once you get used to different control keys and taking
floppy disks out yourself.

For your ST, I'd say you need at least 2M RAM and a hard drive (as for any Mac).
And of course you need a Mono monitor.

Source record: 211442

Hi Atari Networld,

having learned about UNIXMODE recently, I wonder whether there are file utilities (you know, those goodies like ls.ttp, cp.ttp, rmdir.ttp etc., that make shells fun to use) that are UNIXMODE aware. All I could find so far is a package called futilbin.zoo. This is pretty complete, works well, but it doesn't seem to know about UNIXMODE. The files in that package were created in November 1991. Are there any more recent versions available?

Greetinx & many thanx in advance,

1555. Re: Hunter - Is it any good?

Newsgroup: comp.sys.atari.st
Date: 1993-01-25 20:52:56 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1k1jv8INNnb6@golem.wcc.govt.nz>
Source record: 211441

Hunter:

Hunter is optionally, either a Strategy, or an Action game. It has
options to alter the size of the mission, to such a degreee that you
can only complete it using strategy. (To some extent).

Basicaly, no matter what you do - you have to go around shooting people
and blowing up silo's etc.

The graphics are quite acceptable for such a game, with plenty of shades
of green :) Some of the graphics are a bit odd, in one case you have
to find a person, which I found quite difficult, because the guy I
was supposed to find, looked like a coat-rack in a house.

It takes hours to finish it, but has a reasonable amount of variety to
keep you going for a while. The 3D works reasonably well, apart from
the fact that as soon as you go behind something, you can't walk through
the back of it, which causes problems, as the objects turn invisible,
making navigation awkward. Getting into/out of vehicles is simple enough,
but occassionally you keep hopping back into them, when you are nowhere
there them, which is rather annoying!

Plenty of little extras, like sharks swimming around. The enemy soldiers
swim out to greet you with a bullet through the head. Little animals
wander around which you aren't supposed to kill, or you lose credit.

Assortet different weapons, ranging from a hand-pistol, to a rocker
launcher, and timed explosives.
Bulls that charge at you (persistently).

Lots of different buildings etc. Assorted enemy weaponry, dozens
of different vehicles to get into, ranging from a surf-board,
to an apache-like helicopter.

If you like a bit of violence it's good. For those who like high-speed
shoot 'em ups, it's probably not, as it can take quite a while before
anything can happen! (Lots of travelling....)

ST-Format (and others) had a review of it, around a year ago, so you
may be able to trace down their review. From memory, ST-Format gave
Hunter around 85% somewhere!

It does seem that the early 1200's had a few bugs, but I bought one a few weeks ago and none of this has happened to me.

Don't know about the modulator, since I'm using a monitor, but I havent had any display glitches, my PSU is powering an 80 meg Harddisk, and doesn't even get warm after several hours use, and my keyboard works perfectly.

1559. MiNT Distribution kit problem

Newsgroup: comp.sys.atari.st
Date: 1993-01-26 00:13:00 UTC
From: ee90grb@brunel.ac.uk
Message-ID: <C1Fpxo.39r@brunel.ac.uk>
Source record: 211446

I am having a problem with the mint distribution kit.

I have got the INIT=/bin/sh line in mint.cnf and it start up sh OK.
The problem is that it does not seem to run the /etc/profile script.
Also if I type tcsh the login.csh also does not seem to run.
Can anyone help?

P.S I have an ICD host adaptor and when I installed the MinixFS file system
whenever I was instructed to reset the computer I switched off the computer
and hard drive. Reseting this way seemed to cause no problems whatsoever

Thanks

Gareth Blades

1562. gcc/g++ installation question

Newsgroup: comp.sys.atari.st
Date: 1993-01-26 01:27:50 UTC
From: jreiss@magnus.acs.ohio-state.edu
Message-ID: <1993Jan26.012750.23019@magnus.acs.ohio-state.edu>
Source record: 211302

Hello, all!

I recently pulled all the gcc/g++ files off of umich. At least I thought I did. I haven't had time to install them here at school yet, but I gave my Dad a copy at home and he's been having some problems getting it working. So he asked if I'd use my USENET feed (since he lost his some time ago) to post a few questions about the installation.

So here they are. Any help would be GREATLY appreciated.

1. What programs/files do I need to run GNU c and g++? This includes libraries, header files, programs and anything else important.

2. Where do they go? (as far as directory structure and such.)

3. What kind of environmental variables are needed?

As I said above, I thought we'd gotten all the important archives off of umich, but apparently it looks like we're missing some of the files. Also, I guess some of the files got garbaged up somehow (most notably a few of the include files).

So any answers I can get to the above three questions would really help us get this whole thing set up. As both my Dad and I are looking to learn c++, this seemed like a decent system to start up with.

Thanks in advance for your advice!

Joe

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <74370@cup.portal.com>
Source record: 211305

Marcelino Bernardo makes a good point about semiconductor reliability versus mechanical reliability...

Oxidation can occur even with the best gold plated connectors, and when you're dealing with multi-megahertz clock speeds even the slightest added capacitance can throw things off.. the added resistance of a bad connection can also play havoc with signal levels, especially with older logic which doesn't have radical voltage swings between logic levels.

Many times "fixing" the mainframes where I work will be as simple as removing and reseating a circuit board.. just wiping the oxidation from the fingers is enough to get it working again.

So while Warwick had it completely backwards in regard to the reliability of the semiconductor electronics in a computer, he was right about the mechanical reliability.

(The top of my 520 ST's case hasn't had the screws in it for longer than I can remember. Whenever there's a problem, the first "fix" I try is opening the top and pushing all the chips back down.. nine times out of ten, that's all it needs)

Jon Thackray writes about Dungeon Master/Chaos Strikes Back:

[a single Champion in CSB]

>Now, that's interesting. Defeating the initial set of worms must be a
>bit close, or can one hide from them for a while. And can one complete
>the game without needing to fall through the floor at any stage (which
>would be bad news for a low level character)?

The key to surviving that first room in CSB is to back up quickly
while casting Light, then getting the hell out of there...

You can always come back and fight the worms (indeed, you do
return to this room later), but until you get some weapons and
armor, it's best to leave them alone.. there are some nice
items in the secret room off the side of the first room, but
there's a good chance you'd be trapped by worms if you try to
get in there right away.

Falling IS bad... you just have to try not to do it until you
build up some health. Also, again knowing where to go, and what
to avoid is important.. I doubt any single Champion could
make it the first time anyone played the game.. but then again,
I used to doubt a single Champion could make it through DM..

:)
BobR

(Oh.. about a "magic only" trip through DM.. MON fireballs will
"open" doors in CSB, but I never did try it in DM.. the door at the
"None Shall Pass" area can be ignored (there's nothing much worth
getting), but the "Don't Let a Closed Door Stop You" door has to go..
the Champions would have had to have been practicing fireballs for a
while to get that much power on Level 4.. still, it should be possible)

Are there any atari st users in the towns mentioned above?
I live in Turlock, have a faulty 1040st, and I need to isolate
a problem by using a similair machine.......Can anyone please help.

I'm getting lines flying up on my monitor, which make it
impossible to do anything.....

Please e-mail responses to : alx@ceti.csustan.edu

Games sell machines in Europe? Here are three questions for ya.

1. Have you ever been read a German computer-mag. Games what is that??

2. Do games sell machines in Europe just because they do so in England?

3. Did the IBM-PC have good games in the 80's? Did it sell anyway. Did it
sell more than Amiga?

4. Is the A1200 any good without any Fast-ram? Does fast-ram cost money.

5. Does the A1200 have a DSP to make stunning zoom-effects.

5 1/2. Does the A1200 have 16-bit sound. Does a 16-bit A1200 card cost money?

6. Does the A1200 work properly? Is Amiga 1200 a quality product or a rush
job?

7. Is it better to launch a product with lots of faults or wait untill the
machine works properly?

8. Are there any "A1200 only" games out there yet. If not what's the use? Games sell machines don't they?

9. Are everybody sick and tierd of all this questions now?

10. Have anybody discoverd that I have written more than three questions?

11. Do everybody want me to stop now?

12. Do you think I will?

To all those who answerd "YES" on question 12.... You were right.

Party on dudes

Source record: 211313

We are writing a program that deals with sounds for the Falcon at the moment. The first Beta version Fortune 1.0 is already posted to atari.archive.umich.

We would like to include as many different sound file formats for in- and export as possible. So if you have any specific information about these formats (and their file headers) please mail them to us.

At the moment we support DVSM (the format of our harddisk recorder) and AVR. But that is not enough :-)

>Erm, read the value in the address that holds the screen raster line
>position? I don't know the exact address, but no doubt someone will.

I may be wrong, but I think there is a gap between finishing the last line and starting the next refresh, in which case you would tend to get the same value a lot of the time. There is also a delay returning back to the left of the screen after a line has been sent. Good idea though, and still useful in some circumstances even if I'm right.

I'm sure you're copy of the profibuch is in Dutch! Which I find striking considering the current discussion. I mean THAT wasn't necessary AT ALL! But it seemed that there was enough of a market to do that. For your information, Holland has 15 million inhabitants, and hardly any other people on the world (OK, another 30 million?) read Dutch.

It is, however, a pain to use a program that sends MIDI strings in parallel to Cubase. I wrote an MT-32 patch editor that runs as an accessory. Not only does Cubase hide my windows without a clear reason, it also sends MIDI bytes right through my Midiws calls. I get all kinds of exclusive checksum errors and buffer overflows on the 32. As all sequencing software I know, beneath the nice surface there is utter crap, in Cubase as well.

Of course with additionnal hardware you can do everything. But I remember
something in the developer documentation (v 0.3, July 92) speaking of wait
states...
Anyhow, a 32 bit synchronous access in 4 cycles has 2 wait states in it. And
that, you cannot discuss it :-)

The argument about using non standard disk formats for the game software itself is all well and good. OTOH, I can see no possible reason why some software insists on using its own format for save game files. Its a bit stupid having umpteen floppies with different 5k or so save files on each one because the standard TOS routines weren't used for file access.

I don't know about the BJ-5, but I bought a BJ-10e last year and it's one of the best investments I've made... with the exception of my Mega STe of course! :-)

There is sometimes a very sligh problem with line overlap, just like conventional 24-pin printers, but in 48-pin mode the quality if absolutely superb... The ink soaks into the paper JUST slightly so it has an aliasing effect you don't get on lasers so lines look smoother.

I use it with the BJ-100 (I think) driver in Calamus 1.09 and though I haven't seen the output of a DeskJet I'd have to be REALLY impressed to beat the BJ.

One BJ-10e devoted writer!

Yeah, a good amount of advertising is essential. Do you think the magazines would take more notice of Atari if Atari advertised in them thus giving the some dosh? I'm inclined to think that some adverts in say Computer Shopper or possibly (though less useful these days) PCW would be a really smart move on Atari's part.

Message-ID: <1993Jan26.131955@cs.bham.ac.uk>
Source record: 211328

Hi!

A week ago I posted message with a draft proposal for an advocacy section, which I suggested should be called comp.sys.atari.st.advocacy.

Well I've had 10 positive replies, and most suggest the group should be just atari.advocacy.

John Chu sent me a copy of an article posted by David Paschall-Zimbel which had a whole list of new groups. Sorry but I haven't got the time to do something like that myself.

I replied to David but he hasn't mailed me back yet.

I'm getting mail on this all the time, so I'll leave it until Friday and then if nothing else has happened by then I'll properly post my RFD to news.newgroups etc.

At the foot is my proposal again... Anything you think needs adding, write to me NOW!

OK?

David.

REQUEST FOR DISCUSSION
======================

This is a request for discussion on the creation of a newsgroup for debates about the Atari range of personal computers.

Group Name
==========
comp.sys.atari.advocacy

Status
======
Unmoderated

Rationale
=========
This group will separate a section of discussion from the current newsgroup comp.sys.atari.st and atari.8bit.

The discussion of advocacy currently takes up over 50% of the items in the atari.st newsgroup and so it is felt that the original purpose of the newsgroup is being left behind.

New users and people who need information about the Atari ST can continue to use the original group and would hopefully get more attention if there is less advocacy mail present.

What a FAQ for this group could contain is also a matter for discussion.

Discussion
==========
Comments on this proposed new newsgroup should be posted to the USENET newsgroup news.groups. If the reader is not able to do so, comments may be e-mailed to any of the proposers, at the addresses below, and we will post them.

Voting
======
If no problems arise, voting will start one month from the posting date of this RFD.

Proposers
=========
David Oakley dxo@cs.bham.ac.uk
Ian M Rae imr@cs.bham.ac.uk
Annius V. Groenink avgroeni@cs.ruu.nl
Jan Kim kim@vax.mpiz-koeln.mpg.dbp.de

Depends what you mean by most? Granted anything that was sprite based
run a damn site faster on an Amiga, but anything that was processor
intensive like any 3d simulations or other such interesting games
(well, I'm slightly biased here as I'm not much of a fan of normal
shoot-em-ups) generally ran faster on an ST.

Horses for courses I guess.

The 56001 has two 24 bit databusses and one instruction bus. It support fix point instructions
and it has two 56 bit accumulators and a lot of 24 bit registers. The 56001 is indeed a very good processor.

>custom graphics & sound chips, and will sell for UKP100-200 (USD150-300).
>A summer/autumn 1993 launch is expected.

This looks like something that should be Atari's #1 survival priority. Any home product ought to be in stock for Christmas, but for a game machine it's ultimately critical. That pretty well means launch no later than Sept. 1, absolutely drop dead otherwise.

>doesn't "punish" people very much for making mistakes - not even BIG
>ones like saying that my computer is...<omitted>

Very true. It's a "safe" way to be a little naughty. And if one uses an
anonymous address, it's the same logic as kids making crank phone calls.

>>I have run into many people who flagrantly brag that they own a 66
>>MHz 486. That really is pathetic when you stop and think about it.
>Yup, it IS pathetic. For that kind of money I'd get one of the
>low-end Sparc systems, and run rings around those 486es. :-)

Well, maybe you have some really great educational discounts in Canada, but
down here I can't get a Sparc for $1500 which is what you can buy a bare-bones
486-66 for nowadays at retail. P.S.: Getting a Sparc 10 installed in my day
job office soon... fun, fun, fun!

>But you may be missing the point that to many people, flaming IS fun!

I admit that at times, good natured "arguing" can be fun. But "flaming" is a
different animal altogether, IMHO, and certainly not a socially redeeming
grace. :) It reflects poorly on those who participate and makes the newsgroup
a worthless waste of time rather than the help forum it could and should be.
The ADVOCACY line helps... thanks to those that use it.

> Anyhow, a 32 bit synchronous access in 4 cycles has 2 wait states in it. And
> that, you cannot discuss it :-)

Well if you are making "a 32 bit synchronous access in 4 cycles" on a 16 bit
bus there can be NO WAIT STATES. To get 32 bits you must make two 16 bit
accesses. Since each access requires 2 clock cycles, two accesses require
4 clock cycles.

I think what you meant is that 4 clock cycles, to access 32bits, on a
16 bit bus is the equivalent of 2 wait states on a 32 bit bus.

>altogether a true statement -- one of those claims that _should_ be followed by
>a little asterisk for disclaimer. Anyone?

Matt, at this time, all 66MHz 486 machines use what's known as "speed-doubling" technology. Simply put, it allows the 486 processor to run at twice its rated speed (33 --> 66) while the other board components operate at normal speed. The end result is an average overall speed increase of around 85%, give or take a little, depending on how processor intensive your current task is.

Love them, hate them, or somewhere inbetween, you gotta admit that Intel did a real slick one with these speed-doubler chips and were smart enough to keep the prices reasonable (relatively). Of course... pc's need all the speed they can muster just to remain usable. :) IMHO! IMHO!

Okay, let me put in my two cents worth. I work at a computer store. Therefor, I know the prices. I'll do my best to list off some of the things that you'd need in a PC to do what the Falcon comes standard with.

Falcon PC Price
^^^^^^ ^^^^^^ ^^^^^^
68030 80386dx $240 (+100 for case)
2mb RAM 4mb RAM (minimum) $160
MultiTOS OS/2 2.0/Windows NT $120+ (and a wait on windows)
TOS Roms Boot from HD/Floppy We'll get to that later
16-bit color Windows accelerator $170+
w/ 640x480x32k
Graphics Blitter "" ""
1.44mb FDD 1.44mb FDD $60
16-bit stereo 16-bit stereo card $230
8voice playback Not available. Probably VESA.
SCSI II connector SCSI II board $100 or on sound board
MIDI ports MIDI extender $75+
LAN port Ethernet Board $80+
Internal IDE IDE board $35 (w serial, parallel, game)

Hard disks and monitors I won't go into, because they can use the same ones. They both need monitors ($250-$300), but the PC requires an HD, at least 85mb more if you're not a fool. That adds at least $280.

Welcome to the real world, folks.

One question to the people who have claimed the Falcon is being produced in Iraq: If this is true, then how do they get past the total trade embargo placed on Iraq by the United Nations?

Methinks they're not being made there...

Scott

1607. Atari Mega ST2 (complete system) for sale

Newsgroup: comp.sys.atari.st
Date: 1993-01-26 19:07:38 UTC
From: horj@vax5.cit.cornell.edu
Message-ID: <1993Jan26.140738.17035@vax5.cit.cornell.edu>
Source record: 211347
Cross-posted to: comp.sys.atari.st,cornell.marketplace

I've decided to go the way of the PC rather than of the Atari ST; thus, I'm putting all my ST stuff up for sale. This is a nice system for playing games and doing MIDI stuff on -- ST is the system of choice for many computer musicians. For serious use, you'd probably want to add an external hard disk.

I'd prefer to sell all this together, but good offers for the components will be considered.

PRICE : $1,200 or best offer for the whole shebang:
Atari Mega ST2 -- 2 Meg RAM, single floppy (TOS in ROM)
Atari SM-124 hi-res mono monitor
Atari SC-1224 lo- and medium-res color monitor
mouse & keyboard
2 joysticks (one *very* nice Wico pistol grip, one TAC-2)
Casio CZ-1000 programmable synth (8-channel polyphony; *not* velocity sens.)

Software:
Pipe Dream Bard's Tale AC/Fortran
Oids Blockbuster Captain Blood
Populous Wargame Construction Set Marble Madness
Empire Dungeon Master Barbarian
Music Studio Beckemeyer Programmer's Toolkit (csh, make)

All software has original disks, code wheels, and not much else.

All necessary cables are included, of course, as well as two 6' MIDI cables.

Respond via e-mail (HORJ@vax5.cit.cornell.edu), and we can work from there.

This is not true for some Local Bus machines. The Local Bus is wide enough
to support a graphics card with enough bus leftover to snarf stuff off the
harddrive at amazing speeds.

But, if the info I just read off of ibm.pc.hardware is true, then using an
IDE harddrive is useless as they all have controllers timeed to 8Mhz and
have to be reworked to work with Local Bus. (One person called Maxtor and
they hadn't started yet!) Unfortuantly I think there are Fast SCSI II
Local Bus Cards....

Of course we are talking a significant $$ over the Falcon here!

Hmm... Last time I worked for IBM (August 1992), after the big job cuts then,
worldwide labor force was around 360 000... Before the cuts, it MAY have
been as high as 400 000 once upon a time... Now, if you take the world's
population as 5 000 000 000, then IBM is less than 1/12 500 of the world's
population.. Now, Canada is nowhere near the top 10 in population, and we have
30 million people..
>
> "IBM has so much money in the bank that the interest alone can pay
> those peoples wages such that they could stop making computers
> tomorrow and still keep everyone in a job if they had a mind to."
>
This, I do not doubt.. Sure IBM had a big loss, but keep in mind that they
wrote off 7.5 BILLION for pensions which other corporations will have to
do later (new US law which they don't HAVE to comply with until 1994, I think)
IBM figured that this year was probably a write-off anyway (due to the
recession) and thus they might as well REALLY kill this year, and take it to
the competition next year (btw, this is just a GUESS as to why they did it now
- I am no longer affiliated with IBM).

> Some will put unix on it for the price of the system software...

To fibnd out first-hand, I called several of the "giants" about their
full0-blown sytems (Computer, monitor, printer, OS, etc.) and asked if they'd
bundle OS/2 for me. In all cases the answer was a resounding, "NOPE."

I wonder if Microsoft owns them too?

I also called a few of the smaller places who advertise similar full-blown
clone packages, and a percentage (~50%) of them were willing to bundle OS/2
rather than Microsloth.

FYI

My point exactly. This speed "doubling," in my opinion, is purely a result of
clone-fever -- more, more, faster, faster! I'd just like a little asterisk.

^^^^^^^^^^^^^^

Not strictly true, the custom chips can be used to draw polygons in hardware, much faster than the main processor can. Most of the 3D stuff that ran slowly was ported ST stuff, which wasn't reprogrammed to take advantage of the graphics processor :-)

I hope you aren't calling the 68040 just a speed doubled 68030. The 68040
has numerous improvements including a larger internal cache and a Floating
Point chip on board. The larger cache makes it a lot easier to implement
a machine without resorting to wait states or even to an external cache.
The 256 bytes of data and instruction caches each was one of the main reasons
the TT was really not that fast a machine.

Message-ID: <1k4o5dINN8qe@golem.wcc.govt.nz>
Source record: 211202

Well can any one help me, I have a second hand Deskjet to evaluate,
but things don't look right..

If I use Script to print out ver 1.0 , it looks a bit fuzzy, dots that
should not be there, even happends in Epson mode as well, with the correct
printer driver, this error is repeatable 100% and is not random like
a faulty print head...

Could this be a Script fault..??

If I try the built in test, the text looks clean, but the top parts of the
letters are lighter than the bottom, this is on every line of text...

What program can I use that supports this printer with its built font
and with external fonts, like what Script does...

Or is it correct that these printers don't work to well with the ST range
of computers..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

Whats so different about the Falcon doing this for graphics when all data bus transfers on the PC are done at 16 bits and depending on your setup at 8 bits. Not only that, the data transfer speeds are limited on the PC further slowing down graphics speed. Plus the PC doesn't have a blitter.

Why do you say the Atari has a cheap DSP system in it. It is the same DSP
chip that is used on the NEXT computer. Not a flabby system.

> tomorrow and still keep everyone in a job if they had a mind to."

China = 1000M
India = 866M
USA = 252M [CIS excluded - it's a collection of countries]
Indonesia = 193M
Brazil = 155M

So, let's say IBM has at LEAST 156M employees. (though I've probably
missed some other HUGE country somewhere, like Australia :-])

Now let's pay them all the EXTREMELY pitiful wage of $1600 per year.

Now, let's say we get 25% interest on IBM's cash in the bank. Tell me
where I can do that well!!!

So, IBM must have 4*156000000*1600 dollars. ie. ONE ENGLISH BILLION DOLLARS,
just sitting in the bank.

>I dunno how true these statements are but even if there is some truth in them
>then I doubt that the financial loss will hurt them much.

No truth whatsoever.

>A friend of mine was told these 'facts' at his employee induction course with
>a clone manufacturer.

Tee hee, those clone manufacturers probably use the new 100000MHZ chip, too...

Here's an equivalent argument:
"I heard Atari has $10,000,000,000,000,000.
Even if that is only 0.001% true, that's $100,000,000,000,
and let's face it, 0.001% is very much!"

> >Computer Shopper, I could see a DSP board for $300.
>
> Go on then. We're all standing here waiting for you to either do that,
> or stick your other foot in your mouth.

I didn't realise I had one foot in my mouth already. Grabbing my Jan.93
Computer Shopper, I looked through a few pages from the back. The first
Falcon-quality sound card:

Sound Blaster 16 ($239) - 8-bit and 16-bit digitized voice channel;
20-voice StereoFM music synth; MIDI interface; built-in power amp (hmm,
Falcon doesn't have one of those)

Next, I found a DSP card. Not quite as versatile as a general-purpose
DSP board, but it was the first one I found; if I were interested in the
DSP, I'm sure I could find another one (or twelve). Oh, and I guess I'm
embarassed in front of the world, eh? It's $425. Not quite around
$300 but in the ball park:

Sound 2000 ($425) - CD Quality sound up to 44.1 kHz sampling; 32
simultaneous stereo voices with 16/32-bit DSP sampled sound (DSP model
not specified); 127 MIDI instrument sound patches, 47 percussion sounds
built-in; 16-bit digital audio recording (1 stereo or 2 mono
channels)/16-bit digital audio playback (2 stereo or 4 mono channels)
with MIDI interface. Oh, and bundled software.

> Because you keep ignoring the DSP.

Because I have no use for it (it's not going to speed up POV-Ray or
Lexicor's stuff for me) and I haven't seen a useful (to me) application
of it yet. Other than JPEG decompression/compression, which a faster
CPU will handle quite nicely.

> I understand you. If the Falcon didn't have the DSP, I wouldn't by it.
> It would be underpowered and overpriced.

I think it still is. Then again, you've probably got more of a use for
the DSP than I do.

I got all of the 2.2.2 files, the latest MiNT libraries, and a bunch of
other stuff, and jammed it all together... ;-) Warwick or Howard Chu
would be a much better reference here.

> 2. Where do they go? (as far as directory structure and such.)

Wherever you want. Don't mix the C++ and C include files though. Mine
live in:

g:\gnu\bin GCC/G++ binaries
g:\gnu\incl C include files
g:\gnu\incl++ C++ include files
g:\gnu\lib C/C++ libraries

> 3. What kind of environmental variables are needed?

Here's the appropriate part from my mupfel.mup (or tcsh.rc under MiNT):

```
# some of these are probably redundant...
setenv GCCEXEC g:\gnu\bin\
# setenv GCC_EXEC_PREFIX g:\gnu\bin\
# use "unsetenv GCC_EXEC_PREFIX" under tcsh instead of the next line!
setenv GCC_EXEC_PREFIX
setenv GNUEXEC $GCCEXEC
setenv GNULIB "g:\gnu\lib;g:\usr\lib"
setenv GNUINC "g:\gnu\incl;g:\usr\incl"
setenv GCCLIB $GNULIB
setenv GCCINC $GNUINC
setenv GXXINC "g:\gnu\incl++;g:\gnu\incl++\ams"

# Just in case I forget...
alias cc gcc
```

>
>Rune Hyldmo

Wow that is really impressive. What was the pricing on the 3090-600E with vector process and 6 parallel processor mainframe clone? How many models of the E/S 9000 mainframes did they have? Did they also sell the 200 page per minute laser printers for it? How about clones of the smaller computers like the AS/400 minicomputers? What type of Database applications worked on the AS/400 clones? Were they still compatible with the old System/36 machines? How about the smaller machines like the RISC System/6000's? Did they have the full pizza-box to refrigerator size RISC Processors? Could they still handle 256 users logged in at the same time? And then to IBM's smallest market of micro-computers. Did they offer a 24-hour replacement maintenance service?

My point is that while micro-computers are great for home use and a just at the EARLY infancy of office use, many of the problems of large scale computing with thousands of users spread of thousands of mile just isn't available and/or practical right now. Big computers still sell for lot's of money and that is where big companies like DEC and IBM stay in business.

I agree that micro-computers are a might force on the horizon and that in the next decade more applications with evolve for large scale distributed BUSINESS computing. But banks, airplane companies, space agencies, defense systems, etc. can't wait for the future. These industries need the powerful mainframe hardare **AND** software that already is designed NOW! PC's will most likely take this place in the future and it will be a lucrative area of computing, but the business systems are not largely in-place in the highly profitable areas of business and scientific computing.

Look at the large picture if you are going to express generalizations.
I'm not flaming, just mentioning a view point that many microcomputer users don't seem to mention.

Well, I've had it for several months now... I love it! Hunter is
really cool, and tonnes of fun to play. The 3-D vector graphics are
pretty realistic (well...) and fairly fast. The controls are easy
enough to figure out and easy enough to use. I usually play it on the
Mission setting, and it's quite challenging...

Highly recommended; some people will probably hate it though. A friend
of mine, much into wargames, hated it when I showed it to him.

But mainframe sales have already peaked (back in 1991, at 8.22 billion),
and shows no signs of reversing. Also, most mainframe sales are replacements
for older mainframes. That, plus the fact that technological development
is advancing on microcomputers workstations, and midrange systems is
why IBM is in trouble, and why DEC is betting the farm on Alpha and Unix.
No, mainframes aren't gone yet, but their glory days are over,
especially now that you can get "mainframe replacements" from companies
like Pyramid which will compete (technologically) with IBM's ES/9000s, at
a fraction of the cost.
So much for rusty iron....

Kevin Donovan asked about the "magic only" Dungeon Master game...

I think it should be possible, as long as your magic users could do powerful enough fireballs to blast through the doors that can't be opened any other way.. (the ones that normally are "chopped" to get through).

Also, there's the "Cast your Influence, Cast your Might" spot in the Vault.. if you allow your magic users to throw physical objects, then you could get through there..

But even if you disallowed throwing, there are enough keys to bypass one of the areas on Level 3 and still get through to the next Level..

As for actually killing Lord Chaos, not as far as I know..

>Well can any one help me, I have a second hand Deskjet to evaluate,
>but things don't look right..

Question: Which model? There are 3 (I assume you're not talking
about the colour editions :-)):
a) Desk Jet ("Classic")
b) Desk Jet+
c) Desk Jet 500

They're all rather similar, but ARE distinct, and have somewhat
different features. For instance, the set of built-in fonts grows for
the later printers.

>If I use Script to print out ver 1.0 , it looks a bit fuzzy, dots that
>should not be there, even happends in Epson mode as well, with the correct
>printer driver, this error is repeatable 100% and is not random like
>a faulty print head...

>Could this be a Script fault..??

It could be, but it's not 100% clear.

>If I try the built in test, the text looks clean, but the top parts of the
>letters are lighter than the bottom, this is on every line of text...

This probably indicates that you need to replace the ink cartridge.
I've never had this particular problem with my DJ, but then I tend to
replace the ink cartridge, and you may have a nearly dead one.

Not a major problem, depending on how much HP charges for the
cartridges Down Under.

If some of the ink nozzles have gunked up, that could cause the
problem. I'd suggest running it through a couple of "priming" cycles;
there's a button marked "PRIME," which I think makes the printer try
to run some ink through ALL of the nozzles while sitting off-line.
That might clear the nozzles. Otherwise, you probably just have to
get a new cartridge.

>What program can I use that supports this printer with its built font
>and with external fonts, like what Script does...

That's Write supports both internal and "external" fonts; FSM/FONTGDOS
support the Deskjet too. There's a driver file for ST-Writer on
atari.archive.umich.edu; I'm not TOO familiar with the support of
other word processors for the DJ.

Any of the major desktop publishing packages (Pagestream/Calamus)
support the DJ; they tend to do bitmapped graphics, and thus make
little use of the internal fonts.

I use TeX to get "the most" out of my Deskjet; unfortunately, there
are implementations of TeX that run under UNIX, which presumably
disqualifies it from being a "quality" piece of software, under
certain classifications. On the other hand, TeX was written by Donald
Knuth. Enough said :-).

>Or is it correct that these printers don't work to well with the ST range
>of computers..??

The only printers that have "better" support on the ST are the Atari
laser printers, and there's some question there...

> : >this is a dead race!

Although I am an Amiga user, I am not anti-Atari. I've seen the Falcon in action and came away moderately impressed. The Falcon still falls short on some areas I consider important (no internal slots is one point against the Falcon in my book), but I won't dismiss the Falcon out of hand.

Now on to Joern's comments. In an equal architecture an 030 will outperform an 020 every time, yes. But isn't the Falcon's 030 running on a 16 bit bus (not counting the graphics subsystem)? In this case, the difference in clock speed is somewhat balanced by the difference in bus size (16 bit on Falcon, 32 bit on A1200).

In a test of raw compute power (eg calculating mandelbrots), I would expect the Falcon to be faster because of the better caches on the 030 and the higher clock speed. In a general use environment where you're moving the mouse about, opening and closing windows, loading programs and files from disk, etc, I would give the edge to the A1200, because of it's wider system bus (and better throughput capability as a result).

Using high speed modems on the ST is not all that hard, if you have the right
software. You need a program caled SERFIX11.LZH (ZIP, ZOO, ARC?) that goes in
your AUTO folder. It will correct a bug that is present in all Atari systems,
with the exception of the TT I believe. Then set your software to use
RTS/CTS and your modem to use the factory default settings. From there things
will work fine. At least, they did with me. I still have trouble doing
uploads at high speed sometimes, but you will not lose text and you will have
no problems downloading (or uploading in most cases).

I hope this helps you out.

I don't know of that program, but I'm very interested in it. Is it
public domain?

I've made a database by my own with some drinks, but it is not working
correctly and it is VERY SLOW (*yawn*). For example: searching all
drinks with white rum inside lasts about 3 to 4 minutes. :-(

So: if anyone knows about this program, and where to get it (if it is a
pd-program), please email or post here.

thanks.

Yes it was, I think it was a couple of years ago. But the program has been on a.a.u.e, It was named cocktail.lzh, and I though it was in Applications/Databases, but when I looked after, I couldn't find it anywhere under Applications, but a search with archie could be the thing :-)

Are there any decent PD floppy disc sector editors out there? Ie
something that allows you to page through the data on a disc,
hopefully searching for certain information if you want. Dunno, just
a thought anyway.

[deletions]

>(Leaving out dtp and wordprocessors because I can't imagine trying to
>write these would be anything but boring).

Actually although at first glance this may appear to be true, somewhat
surprisingly I found it quite interesting (and instructive) to put
together a working word processor, its a good exercise in dynamic
memory management, file handling etc etc, plus of course you get to
put all those functions that you've always wanted on a word processor
but were afraid to ask for.

>
>(strange cat you've got)
I'll second that.

Source record: 211282

I thought I'd take a look at the Gemfast libraries the other day, so I downloaded them from a.a. I wanted the sources since I'm using Lattice C, which is not supported in binary form, so I downloaded the sources in the form of several .lzh archives. I then tried to unarc them to my hard disk. After about 30 minutes of waiting hoping in vain that lharc would stop writing to the disk, I resigned myself to having to reboot the machine, screwing up that partition of my hard disk in the process (rebooting when a file is being written to and the FATs/directory haven't yet been updated). Lharc had gotten seriously confused by the files, and tried to write something to an infinitely large file. I've got 3 problems with this, all of which reinforce the arguments people have made against lharc in the past:

1) Why does lharc not recognise that an archive is in a format it no longer supports/doesn't support yet (in my case the former, I suspect)

2) Why does Lharc not respond to an abort signal such as Ctrl-C, and stop what its doing cleanly (just doing a listing of the archive contents had the above effect as well, and even the low level, hacky, interrupt anything feature of my shell wouldn't stop it)

3) Why doesn't Lharc recognise the disk full condition in the above example and stop then. At least then the disk wouldn't be corrupted?

FWIW, I tried using lharc versions 2.??c, d, i and l (2.?? - I can't remember the minor version number, is it 2.01?)

>is dwindling and
[deleted]
Curious one that, maybe someone should tell Cray Research and the
numerous other mainframe manufacturers plus the dozens of big
firms who regularly solve massive problems on mainframes that this is
happening so that they can go solve their problems on micros.

>Anyway, what does this have to do with Atari? Absolutely nothing.
Atari have recently announced the launching of the Atari MF, this will
apparently be a multi processor mainframe system capable of nearly 15
GFlops and will retail at around 15 million US dollars. An
unconfirmed report suggests the machine is in fact a large box with
4000 Atari ST's in it, this was denied by a spokesman, but he did
mention that attempts to open the 'box' would result in all the
contents melting down into a pile of plastic and silicon.

In <jonal.122.727891145@dhhalden.no> jonal@dhhalden.no (JON ARVID LOVSTAD) writes:

>What about if some of us who can I/O both German and English volunteered to
>translate a chapter each...??

I think this is a good idea, and I'd certainly volunteer for such
a project (I'm native German, and my English... well, look at my
postings, it sort of works... :-). However, it seems to me that
we have another example here how copyright can prevent a good
plan from being done. Copyright "protection" of printed books
normally states that the book may not be translated to another
language without explicit consent of the publisher.
This means, if we can find a group that is willing to translate
the Profibuch, we'd have to get into contact with Sybex. I'd
expect that then, the Sybex folks would doubt the professionalism
of such a bunch of people as translors. They may finally agree,
but under the obligation that the translated version may not be
made available to anyone but them. Then, they'll take the English
version, and if they think it is properly done, there might be a
chance they actually print it.
Because of all these hassles that would inevitably accompany a
Profibuch translation project, I restrict my statement about
volunteering the following way: I would do it, but only if
someone else negotiated with Sybex in advance and made sure that
they are going to publish it.
Maybe Julian Reschke can comment on whether there is a chance to
get things going under such reasonable conditions.

Greetinx, Jan

P.S.: Is there anyone from the pro-copyright fraction who wants
to argue that volunteers translating the Profibuch would do any
harm to Sybex...?

But software (games) can't really be written to use local bus video.
The software (games) vendors need to target the largest maket which is still
(and probably will be for a very long time) video on the ISA bus. I know
local bus video is software transparent to VGA but the games will be 'timed'
for VGA on the ISA.

You guys are missing a basic business point here. IBMs loss cannot simply
be absorbed by its savings, as it will not be producing anything to
make that money. This will hurt their SCF, and their stock would only
fall further (to say nothing of their bond rating, over at Moody's).
Plus, any money IBM has got stashed away would be put to better use
than a savings account. If they have money out there, it would be
invested, and investments tend to be less liquid than savings. They'd
be able to get their hands on that money eventuaolly, but if I worked
at IBM, I sure wouldn't like knowing that that was where my
paycheck was coming from. Lastly, IBM's holding s are not its to just
dole out when it doesn't make monyxxx money, they belong to the shareholders
(and creditors have some claim on them too).
No, I don't think IBM will go under tomorrow, and even a hurt IBM will
outdo a lucky (hypothetical) Atari in the foreseeable future.

You've got your market segments mixed up. Cray sells supercomputers. IBM sells mainframes (and minis, workstations, and micros). The mainframe market is sliding, in a part because of those very businesses you described who are so costly to keep the mainframe running. Why do you think IBM has been pushing the RS/6000 lately?

You can use any kind of multi scan monitor to connect it to the FALCON.
This monitor will be able to show all non-interlaced resolutions.

It could be possible that the interesting resolution 640x400 truecolor interlaced can not be shown on any kind of VGA-monitors. For this resolution you will probably need a normal TV.

I've always wanted to get the old arcade game TEMPEST for my ST. It
was an old vector-monitor game popular in the 80s where you went
through a variety of shapes blowing away baddies that came up at you.
Very stylish. You can still see them around some of the arcades. Don't
know if the atari can handle the speed or not but it's be great to
see. Could be handled entirely by the mouse. Something I'd definitely
pay shareware costs for, maybe others would too.

Is all.

>>giving it a extra 10% over the A1200. Summing it all up, my bet is that
>>this is a dead race!

> Shouldn't that be 16Mhz - 25% ?
No, the fact that the 030 is running at 16Mhz compared to the 020's 14.4
will give the 030 a 10% improvement. The fact that the 030 is on a 16
bit bus and the 020 a 32 might give a 25% improvement to the 020. He was
talking (quite obviously, actually) about the effect of the clock speed
isolated from any other issues.

> Also the Falcon doesn't have the custom graphics chips that the 1200 has,
> so its going to be slower still. Remember the ST 68000 was faster than the

I don't buy that. My friend used to have a 1040ST. He sold it and bought an
A500 about 12 months ago because the Amiga had more games available for it
(he only used both machines for games). He's now bought an A1200. One of the
first things he noticed about the A500 was that it ran equivalent games slower
than the ST. For the record, he had about 3 (maybe 4) meg of ram in the A500,
configured (as chip or fast ram) in what he'd been told was the optimum
configuration for extra speed.

It is indeed even without GDOS possible to install GDOS fonts using CoNnect.
Just put a folder named GEMSYS in the CoNnect-folder and place there all
the GDOS fonts you want to use. In the display dialogue you ca then select
one of theese fonts. Included in the archive there is a font
named CONNECT.FNT which is not to small to work with but you can see 24x80
on the window.As CoNnect is completly based on GEM you probably will
need a screen accelerator like NVDI or WARP9 to work on a normal 8MHz
ST. But CoNnect uses a lot of optimisations in output that you can surely
call it one of the fastest GEM-based Comms-Programs on the ST. And CoNnect
iss the only one, that passes the vttest (Test for vt100/vt102 Compatibility)
programme completly.

And! For registered users there will be an english manual (more than
100 pages) available in about 2 months. (better English than my one ;)

That's quite true. And the Falcons have been stockpiled there
until recently. Then, Atari decided to ship them on supertankers
throughout the world, for reasons of cost effectivity since the
quantities were so large. Unfortunately, two of the shops have
gone wreck, hence the worldwide shortage...

I would not recommend a multi-sync. Just get a VGA monitor. Once you
start using the higher resolutions you rarely go back to any ST
resolution. On my TT, the only time I switch to an ST resolution is
to run CAD-3D V2.0. Otherwise I stay in TT medium resolution.

I spent a considerable amount extra on a multi-sync monitor, and I
did not need to.

1676. ADVOCACY: Prices, Prices, and more Prices.....

Newsgroup: comp.sys.atari.st
Date: 1993-01-27 17:20:16 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1993Jan27.122016.15290@miavx1.acs.muohio.edu>
Source record: 211292

Well, I just received the recent Micro Center ad, and form the
looks of the prices, I really don't see anyone buying a Falcon other then
musicians.

First, we have the Macs..... Hmmmmmm, a LC II with 4 megs of ram
and 80 meg hard drive... $1190 (All prices I'm going to quote are without
monitor, just to keep it in line with the Falcon without monitor) IIsi,
same config, $1500.

Oh, you don't like Macs. How about an Intel based machine.
MicroCenter doesn't even carry any 386 machines. (Except for notebooks.) A
Compaq Prolinea, with a 486sx, 120 meg hard drive, SVGA, and 4 megs of ram.
(Also a fax/modem) $1398! (Also included is one-year on-site support!!)

As much as I would like the Falcon to succeed, I don't see it
having any sort of success anywhere but the musical world, and then only
until a DSP card comes out for the Mac or Intel world. (And people use the
argument that since they weren't built in, software won't support them. Is
that why Miami here just bought 12 macs for use with Midi? Once a DSP card
is released, support will follow)

(I'm not associated with Micro Center at all, and I'm not trying to be an
advertisement, I just wanted people to see prices other than mail-order.)

Later.......

1677. ST-Falcon Swap Scheme Concept

Newsgroup: comp.sys.atari.st
Date: 1993-01-27 17:46:35 UTC
From: sbrown@cs.hw.ac.uk
Message-ID: <1993Jan27.174635.14917@cs.hw.ac.uk>
Source record: 211293

Newsgroups: comp.sys.atari.st
Subject: ST-Falcon swap scheme concept
Summary:
Expires:
Sender:
Followup-To:
Distribution: world
Organization: Dept. of Computing & Electrical Eng., Heriot-Watt University, Scotland
Keywords:

Wouldn't it be a great idea if Atari were to offer ST owners a swap scheme
in order for them to get their hands on a Falcon?

I bought a 520STFM in March 1990, right before Atari decided to dwindle the
price of an STE; since then I've upgraded to 1Mb, got a sampling cartridge
and an external floppy disk drive: the point is, if I were to get a Falcon,
all this stuff would be useless! If a swap scheme was in operation, Atari
could take our old hardware (use it for spares or sell it again for cheaper
perhaps) and give us a spanking new Falcon: obviously we would have to give
Atari some money as well; they can't give away Falcons!

I seem to remember Commodore offering a similar scheme for Amiga 500 owners
upgrading to a CD-TV. If Commodore can do it, it must be viable (that or
Commodore have egg on their faces). Atari don't even have to operate it -
perhaps respectable mail order companies could do it, keeping the STs and
disk drives, etc. for resale or repairs.

Despite my enthusiasm for such a concept, I doubt very much whether it will
come true: I'll have to sell my ST system for a pittance (FMs can't be worth
very much now if you can get an STE mail order for 250 pounds) and save up
the money to afford the (allegedly) newly-boxed Falcon when it arrives on
March 1st (or whenever).

Well, I suppose, if you don't dream, then you'll never have a dream come true!
(do sing along, Captain Sensible fans!)

Before I go, a question: 'Will Sensible Soccer be available on the Falcon?'

Cheerio, Atarians.

1681. Using Atari ST & UNIX-Box with NFS-Like software

Newsgroup: comp.sys.atari.st
Date: 1993-01-27 19:10:18 UTC
From: sledge@rama.informatik.rwth-aachen.de
Message-ID: <1k6mmqINNqdd@urmel.informatik.rwth-aachen.de>
Source record: 211241

Hi folks,

I'm desperatly in search of a solution for my problem.
At home I'm running a 486/33 with 16mb as an ISC-Unix box.
But still there is my old atari-st with 1mb and a 50 mb harddisk,
tied to my unix-box via rs232, using 19200 baud. so far, so good.

Using uniterm or any other terminal-soft it is possible to use the
atari-harddisk for sources or seldom used resources.
BUt this solution is not perfect. It must be possible to access the
ataris HD directly from the AT, but how.
Something like a NFS should it be.
So here my question to you atari-wizards (hope there are some):

Is there any PD-soft (or cheap soft) which covers my needs ??

ANY help will be appreciated.

answer via email, please. I'll post a summary, if desired.

Thanks in advance Thomas

I know that this is wasted bandwidth in some people's opinions, but I just wanted to thank all of the people that answered some of my recent questions posted here. Even with all of the bickering and such going on, it's nice to have a GREAT resource like this to get going with my computer. I had put my 1040ST on ice for a couple of years because I had no support what-so-ever where I live, and this group has given my computer new life!

Andrew West
awest@ub.d.umn.edu

ps...as long as I'm here, I'll ask another silly question:

On the panel of my computer it says "Atari 1040ST" and then there is a tiny letter "f" right next to the 1040ST. What does this mean?

>hould be impossible...
>

Sherry, you didn't mention it but which machine (aka, which TOS) are you using? This sounds like a problem with TOS 2.05/2.06 in which the compiler doesn't like XCONTROL.ACC. There are two fixes:

1) Run the compiler _without_ XCONTROL.ACC loaded.

2) Change the RESERVE memory setting in the compiler source code and recompile. Start up your interpretor and load MENU.GFA (the compiler source code) find the RESERVE line near the beginning of the file and change it to some huge number (I use RESERVE 150000, I think). Then RUN the program in interpreted mode and use it to compile _itself_ saving the newly compiled file as MENU.PRG. Tricky, eh? For safety's sake, be sure you maintain a backup copy of the original MENU.GFA source, OK? ;-)

Anyhow, either of these should resolve the compile problem judging from how you described it. If not, let us know...

But if you get a multisync, you can use it on your Falcon030, Falcon040?,
PC, Mac, or whatever you get next time. If it syncs down to 15 kHz
you can even use it with your ST. (But then, next time, you'll probably
want 1280x960)

(A related question: I know the NEC 3d syncs down to 15khz; but what is the
range of the 4D? The 3FG will NOT go down to 15khz, so it's falcon only)

Rather than sell for a pittance, consider donating your equipment to a teacher who does not yet own a microcomputer. There is freeware and shareware available for many of the tasks a teacher might want (there is even shareware gradebook software available, although I don't know how well it travels outside the United States).

There are also a number of preschools who would love to get their hands on a 512ST with RF modulator, but could never afford a computer on their limited budgets. The ST, along with children-oriented software such as the KidPrograms by D.A. Brumleve, would be greatly appreciated.

Yes that's true. You can't take advantage of a feature unless you can be assured it's there (which is a deadly assumption when it's Local Bus (of some time, they aren't all the same) and an PC). But it will affect the users perception of GUI use (windows, OS/2, NeXTStep 486).

As I said a similar problem seem to crop up using IDE harddrives. They never expected to run them off a bus faster than 8Mhz so never designed them to handle more than that.

I believe you were slightly misinformed. The factory was just making cheap
Falcon decoys.:-) This was a Tramiel strategy to mislead Commodore.

|> want 1280x960)
|>

Well I do not have any specs on a falcon 040 so I do not know if it
going to do a higher resolution than 640x480. If it does then a super-vga
monitor would be in order. However there are monitors that are multi-sync
that do not go down to ST-low/medium (15khz), but do cover VGA, XGA, and SVGA,
these cost around $150 -> $200 less than full-fledged multi-syncs.

I say look to the future. More resolution is GOOD. Besides clone owners
are dumping colour VGA monitors for around $100, making them the best deal.

You know all that upgradability does cost and with the glut of VGA monitors
on the used market, people basically have to give them away. Such a pity,
pay $400 -> $500 for a VGA monitor, and two years later its almost worthless,
to a clone owner that is. :)

1696. ADVOCACY: More prices, prices, prices

Newsgroup: comp.sys.atari.st
Date: 1993-01-28 01:41:23 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1993Jan27.204123.15299@miavx1.acs.muohio.edu>
Source record: 211211

Well, I just thought I would post some more prices. (I have the
flyer in my hands now instead of going from memory)

These are from Cincinnati's Micro Center Store. (I won't post a
number, I don't want this to be to big of a advertisement :-) Everything
doesn't include a monitor, unless specified)

Macintosh prices:

Mac LC II 4/80 $1079 (with keyboard)
Mac IIsi 5/80 $1449 (without Keyboard)

Intel Based: (MicroCenter didn't even advertise any 386 based systems
(except notebook computers))

Entry Level System:
486sx, 1 meg, 40 meg hd, gray-scale monitor, dos 5 (oohh!)
$799

Complete System:
486sx, 2megs, 100 meg hd, vga monitor, Windows (ooohh!)
$999

486dx system:
486dx, 4 megs, 100 meg hd, svga monitor, Windows, mouse
$1499

Accelerated Windows System:
486sx, 4 megs, 100 meg hd, svga monitor, accelerated
graphics card
$1399
(for $200 more you can get this with a 486dx2 at 50Mhz)

I don't see with these prices that any company can ever successfully
release a "non-standard" computer and have it succeed. Unless... it was
backed by solid support and offered better value for the money.

(I just wanted to post solid numbers from something other than mail-order
places)

Later.....

1697. If .AU file is 12 bit, what happened to 4 extra bits?

Newsgroup: comp.sys.atari.st
Date: 1993-01-28 02:17:54 UTC
From: C556212@mizzou1.missouri.edu
Message-ID: <16B6311D72.C556212@mizzou1.missouri.edu>
Source record: 211220

While trying to convert an .AU file to something my Replay 4 cart. could handle, I asked for help converting the file here on the net. One of the replies (sorry I lost your name) told me that the .AU file is a 12 bit Sparc station file. If such is true, then when I ran the DIGISTUFF convertor file that turned it into an 8-bit unsigned .SND file, why wasn't the file size cut down by 30%? (In fact, it was the same size!) If there is some funny math going on, where might I find a 12 bit sound player to take advantage of the extra sampling? Or was that somehow done by the convertor? The converted sound quality is on par with what I expected from an 8000 HZ sample comprised of only 1.2 Meg, but lasting 6 minutes. Is a Sparc station's reproduction really supposed to be that much better?

This is kinda wierd, but - here I go.

There is a program on IBM PC's called pfs: Professional Write.
Nothing special, but for one attribute: It has a "drawing mode" where
the ASCII Line Drawing Character Set is "painted" onto the screen with
the cursor. You just choose the line style (Single or Double) and it
places the appropriate characters on the screen. This is great for
tables.

What makes this unusual is that I am WELL AWARE that there are better
ways to do tables and graphics that the 1979 (?) IBM line drawing
standard. However, my father switches regularly between his PC at
work and his Atari at home, and this method ACTUALLY WORKS FOR HIM!!!

He doesn't want nor need anything else. So what do I want?

Is there a program like this for the ST? He'd like to be able to
"paint" at home as well. Just a simple ASCII text editor that has
a similar mode.

Flames are not supported, nor appreciated. He can't afford a laser
printer, and I'm just being kind.

The ever unselfless,

>You work it out. That's EXACTLY what his statements mean.
>
>Of course, it's not what he meant - he just loves flaming. Roll on c.s.a.a!

I'm wondering how much of the recent flame fests are just that...people
who love to argue.

I mean the simple facts (as I see them) are:
- '486 machines are getting mighty cheap nowdays
- if most of us *really* thought they were better we'd be posting
in comp.sys.ibm.pc or comp.os.os2.misc
- The Falcon is a nice computer with some neat things especially
in the sound department (if you're a musician
you're probably salivating....)
- Just because it's good doen't mean a thing
- The Falcon still has plenty of hardships against it:
o Atari makes it and people pick on them
o Atari makes it (and they market so well....)
o Those '486 boxes get cheaper all the time
o Apple is actually starting to sell computers at only
slightly outragous prices (LCIII 4/80 1379 ?!?, got
this off one of the mac bases so who knows)
o Hey the price on that Falcon looks a little high too
(Assuming a 4/65 is $1300, sure hope that's closer to
$1100 than $1300)
o Atari makes it (so important it's in here thrice!)

Of course the main point is that Atari (and the Atari community) just can't
put our heads in the sand and ignore PC and Macs (*warning! cheap shot
coming*)(But we can ignore the Amiga). I haven't seen some of the new crop
of Atari software but I haven't heard of anything that quite competes with
Excel or Word let alone Quicken and the host of CD-ROM stuff that abounds
for the PC and the Mac.

But, there also seems to be some neat stuff coming out for the Falcon
Blackmail, a Genlocking Video Titling thingy, better MIDI software, and
better paint programs. I wonder if anyone is doing ISDN on the DSP.
(It's possible because it's done on the NeXT with *less* DSP memory).
There's also the rumor of a Falcon 040 and a CD-ROM Falcon (which might
be able to run CD-I stuff). But I guess we really should try to go
vapor for vapor with the PC/Mac world. If you think Atari is the master of
RSN you haven't *ever* listened to Microsoft (You know what NT stands for?
Not Today, Not Tommorrow. Next Tuesday.....)

Oh golly. How can one post so much mindless drivel in one night? Easy
when you're stuck in a lab with *nothing* to do, you post drivel right?

>Atari some money as well; they can't give away Falcons!

Though this would be good for the consumers, it would be devastating to
the dealers. Because there are so few dealers out there, Atari must not
pull a fast one on them. Many dealers offer swaps themselves, but in my
opinion you can get a better deal by selling you computer here on the
net. It would be different if Atari had an expected 1,000,000 userbase
willing to buy the FALCON but they don't, they have no choice but to
distribute this fine computer through the dealer network....

>Anything that's video intensive f.e.

Note that in the monochrome video modes, the bustest program (posted here
last December?) shows no slowdown whatsoever for 16 bit accesses, and less
than .01% slowdown for 32 bit accesses. (I.e., the 68030 cache delivers
100% of the theoretical performance.) I posted my timing results to both
this group and comp.sys.amiga.advocacy; I am still waiting to see the
equivalent results for an A1200. If you need the source code again I will
send it to you; I rewrote it in MIT syntax (for GAS) and still have the
original Motorola syntax posting.

This has made me curious. I know lots of graphics stuff dies on a TT
(Gemview is a big exception, Mgif too), but what animation stuff works on the
TT? What plays .SEQ?

And while I'm on it, where can we get a copy of this Amy Vs The Walker?
(and what is it?)

>Carlos Varela

>MikeB

Amy vs The Walker is an animation in which The Walker (from the STAR WARS
movies is chased by Amy branding (sp?) a screwdriver (sp?). The animation
looks like a cartoon and its very well done. It looks like an Sunday
morning cartoon. You can probably get this one and many more at any amiga
FTP site. They are in IFF ANIM format and have to be converted frame by
frame to the ST (Unless someone made a converter that I'm not aware of!)
The name of the author is Eric Schwarz.

Jon Henderson had some questions about Captive..

I dunno about the music.. my 520ST never gave me any, and I'd assumed that the STe might be supported.. but I guess not..

The only thing I can think of is that the game was originally developed on the Amiga, and maybe they left the music out of the Atari port.. (Captive is available now for the PC too, but I haven't seen it yet, so I don't know if they get any music or not...)

As for finding the entrances on the planets, the best way is to get a Radar Dev-Scape and leave it turned on as you explore.. the entrances will show up as a bunch of radar blips..
Other than that, using the "right hand rule" is one way to cover as much area as possible.. just stay to the right as you move, always turning right whenever you can.. (or left.. it doesn't matter, as long as you're consistant). You still have to check out all the walls that might hide a door, but you should be able to cover the surface area without missing anything..

Also, the "Mapper" Dev-Scape works on the planet surfaces too. You can use it to see if you've missed anything.

>Chris Brown

I have heard programmers say more than once that it is just too much hassle using some of the Amiga's hardware (and naturally, too slow when used through the OS, which is the only compatable way), and they much prefered a machine with a processor fast enough to handle things itself (ie STs).
I was looking through an Amiga manual some time back now, and I from what I remember, all the hardware can do is draw horizontal lines. Now while this is exactly what is needed by most polygon drawing routines, unless the polygon is very large the setting up of the coprocessor takes longer than embeded 68000 code would to draw the horizontal lines. If you access the hardware through the OS (Which is now the only way because CBM no longer document the new chipsets at a hardware level), then you would have to have a gigantic polygon for it to be faster using some coprocessor or other.
Sprites are a different matter though - from what I remember they are overlaid on the screen memory by the video circitry with out taking any processor time or changing the screen memory. As has been said this makes the Amiga far, far better than the ST for those moronic Super Mario-type games that 5 year olds seem to like to much.

If I remember correctly, Dungeon Master used direct DMA for it's disk access
(BAD!) and so doesn't care what TOS version you have and thus will probably
work fine. Not that using TOS to load should make a difference.

Falcon is file based but may or may not work depending on whether
it loads to an absolute address since that address may be in use by TOS.

As for Pha$ar, I have no idea. Never heard of it.

:
: What's PoV? What I can do with it? Modeller?
:

POV (Persistance Of Vision) is a very sophisticated raytracing program,
which is based on the old DKB raytracer (I think). It generated several
file formats (targa, ppm(?), raw, .dmp), and is perhaps the most complex
although not the slowest raytracer you can get for free. It can even
map GIFs on surfaces etc.

-MY

PS: I've been asked to send the original distribution and diffs to
atari.archive, I'll see what I can do... I could also upload
ca. 6Mb of zoo-ed .raw pictures (24 bit 320x200) that can
be displayed with Photochrome - these were generated from the
sample 'scene' files that come with POV.

1722. Atari ST System For Sale

Cross-posted to: misc.forsale,comp.sys.atari.st,rec.music.synth,ont.forsale,kw.forsale,uw.forsale

I'd like to upgrade my computer system so I am going sell off my old tried and true Atari ST system. I am looking for either a Mega 2/4 or STE as a replacement. The system listed below that is for sale has been with me for 6 years and used without a major problem. I am not sure of asking prices so mine may be out of line - I can't tell.

Atari 520ST (original) upgraded to 4 meg with Datafree board. You can either have my spiffy black computer (both case and keys) or I can repackage in a standard grey atari case. The 4 meg upgrade has been complete reliable. I use this machine everyday extensively with no problems.

ICD 48Meg hard disk system. Case, nice power supply, drive and battery backed RT clock. Good drive based around a 138 RLL disk. Space and connectors for another drive. Will load with software.

External SF314 doubls sided floppy drive.

Atari SM1224 colour monitor.

I would like to see $700CDN for this system, negotiable.

b>really need a full blown 14.4k FAX modem?

2400 Baud data connections are boring! I bought a 2400 modem because I couldn't afford a better one. But then I started saving my money for a 14.4k modem very soon.

In addition, I think it's more economic to buy a 14.4k modem. You have to spend 3 to 4 times as much money for it than for a 2400 modem, but it gives you 6x more speed (prices here in Germany, only approx.) and by this will reduce your telephone bill.

I don't have any experience with FAX, but I think that the same suggestions as above should apply here.

No, this restriction applies only to the original Intel (PC) version of Minix.
The author (A.Tanenbaum) insists on keeping Minix compatible to those poor
8086 PC's (which may be right because that version of Minix was sold the most).
On the 68000 version of Minix your physical memory is the limit :-)

Jez San, the leader of the team that wrote Starglider I and II, said that both machines ran at roughly the same speed when doing 3D polygon work. The ST did the 3D calculations slightly faster since the processor ran faster (less DMA going on), but the Amiga drew the polygons faster (custom hardware).

Overall, the two effects balanced out.

1726. Re: Assembler routine that generates random numbers?

Newsgroup: comp.sys.atari.st
Date: 1993-01-28 12:02:14 UTC
From: sbrown@cee.hw.ac.uk
Message-ID: <1993Jan28.120214.19307@cs.hw.ac.uk>
Source record: 211149

The well-known computer scientist Knuth wrote a number of volumes of books entitled 'The Art of Computer Programming', one of which contains a section on the generation of random numbers.

Having required a random number generator for a Pascal program recently, I used the following relationship:

```
seed:= (109 * seed + 853) Mod 4096;
```

This gives a series of random numbers guaranteed to not start repeating itself for at least 4096 uses of the generator; this may be sufficient for most needs.

This relationship could be implemented in 68000 as follows:

```
random:
move.w seed,d0
mulu #109,d0
add.l #853,d0
divu #4096,d0
swap d0
move.w d0,seed
rts
seed
dc.w 0
```

This gives d0.w as a reply in the range 0 <= d0.w <= 4095. The seed could start off as anything you want, but to make it more random you could read the current time (just as the seed for the system random number generator) or you could even use the system's random number generator to make the seed up for your random number generator!!!

If you want to do values outside the range 0 to 4095 or increase the number of uses before repeating, I recommend reading Knuth's book as it describes strict rules for getting the best random numbers possible on computer.

I hope this helps you. Bye!!

Well in use this doesn't actaully seem to be the case. I have a program, written in compiled BASIC on my 1200, which uses the AmigaDOS Graphics.library to bulid up shapes from filled triangles using the blitter, and it is incredibly fast. It also uses a negligible amount of processor time and any other programs I'm running (including 25fps animations) still run at full speed. The point is that if you use the Co-processor to perform your effects, the processor is still free to perform other tasks.

Actually, the hardware sprites tend never to be used by games, which rely on the blitter to produce software sprites. They are, however, used quite a lot under AmigaDOS. The mouse pointer is a sprite, and SoundTracker and MED type programs tend to use them as equalizer bars. They are quite good in these circumstances since, as you correctly point out, they are overlaid on top of the screen, and can have their own resoloution and palette.

I was wondering if there is an SPL TO AVR(I think it's AVR for Stereo Master)convertor so that I can use my .spl samples on Stereo Master.

Sean.

So Who needs a .sig anyway?

1731. Re: Assembler routine that generates random numbers?

Newsgroup: comp.sys.atari.st
Date: 1993-01-28 13:41:58 UTC
From: doucet@ripolin.laas.fr
Message-ID: <8739@laas.laas.fr>
Source record: 211053

I've got one pseudo random algorithm that is not so bad: here it is
(sorry, I can't write assembler):

```
M : INTEGER := 971;
A : INTEGER := 11_113;
B : INTEGER := 104_322;
SEED : INTEGER; -- has to be initialized !!!

function RANDOM return FLOAT is
-- returns a pseudo random X: 0.0 <= X < 1.0
begin
M := M + 7;
if M > 9_972 then
M := M - 9_871;
end if;

A := A + 1_907;
if A > 99_990 then
A := A - 89_989;
end if;

B := B + 73_939;
if B > 224_728 then
B := B-96_233;
end if;

IRAND := ((SEED*M + A + B) rem 100_000) / 10;
return FLOAT (IRAND) / 1.0E+4;
end RANDOM;
```

You'll note it uses long integers.
Bye.

>- Leo

Arrgh! Don't talk about things you don't understand! The amiga hardware is
quite possible of filling polygons. The blitter can be used in a fillmode
which allows it to fill areas outlined with 1 pix wide lines. So what you do
when you want to fill a polygon is to:
1. draw the outlines of the polygon with the blitter. (Yes, the lines DON't
have to be horizontal! *surprise!*)
2. fill the polygon with the blitter.

3. and it is all done!
This gives you a 1 bitplane polygon which then is copied (with the blitter)
onto the screen bitmap. So don't say the blitter is worth less!!!

OK, this goes for an amiga 500, if you have a faster cpu you might gain some
time by using the cpu to do some work.

And about the OS.... Nobody cares about comodore! If they don't release
a Hardware Ref. someone will (some hacker maybe). BTW the reason to why C.
don't release a ref. is maybe because they wan't to include there new chipsets
in it! The chipset that is about to be release sometime next winter... :)

Now for the sprites! If there is one thing you Atari coders don't have to worry
about it is the amigas sprite hardware, it is useless! It is only possible to
show 8 (eight!), 2 bitplane, 16 pixels wide objects. Ok, they are nice but
they are to few. Almost no game uses them for anything important.

Finally I would like to get some information about a computer I don't know
anything about, the atari st! :) So if you have been hardware bashing the
atari and think you could convince me to buy one (or a Falcon!), then please
send me a mail. (Yes i am tired of the amiga!)

A while ago I asked for information on FTP sites with Adobe fonts or Clip art that would work with the St. Alot of people asked me for info, but I'm afraid I only had one response.. and that was with fonts.

If you need fonts, look at wuarchive.wustl.edu in the /mirrors/win3/fonts/ directory and there are some fonts there.. (although many wouldn't work with pagestream, sigh.)

If anyone else knows of a good place to get clip art and fonts, feel free to mail me... thanks.

From: ganderso@unl.edu
Message-ID: <1k8sbjINNhg8@crcnis1.unl.edu>
Source record: 211105

I have the following ST games for sale. They are all in like-new condition, with all the original boxes and docs (though the GUNSHIP and BORROWED TIME boxes do show some wear). These all ran fine on both my STe and STf with color monitor (except where noted) -- your mileage may vary. I'm asking --$11 each-- and I'll pay the shipping (within the U.S.). Plus, I've got some ST magazines, some with disks, that I'll include with each order as long as they last.

BORROWED TIME Sam Spade-type P.I. game
DEFENDER OF THE CROWN knighthood, chivalry, jousting, questing, etc
GUNSHIP attack helicopter sim (STf only)
HARLEY-DAVIDSON motorcycle sim/biker game
MEAN STREETS future-P.I. in San Francisco
OO-TOPOS escape from a hostile planet
PREHISTORIC TALE dino-arcade (plus bonus game WINGS OF DEATH)
PRESIDENT ELECT presidential campaign & election sim
ROGUE addictive dungeon adventure game

> move.w d0,seed
> rts
>seed
> dc.w 0
>

Your not seriously suggesting using DIVU to get the modulo 4096 are you?
What is the matter with good old AND #4095,D0? Why ADD.L?
The fastest way (probably) is

seed EQU 0
LEA base(PC),A6
.
.
random:
MOVE.W seed(A6),D0
MULU.W #109,D0
ADD.W #853,D0
AND.W #4095,D0
MOVE.W D0,seed(A6)
RTS
base:
DC.W 0

Use the 128x-16x-4x+x expansion for 109x may or may not be faster still,
but probably not worth while because you would change another register.

1736. Question about Falcon SCSI-2 bus.

Newsgroup: comp.sys.atari.st
Date: 1993-01-28 15:01:04 UTC
From: wmtwen@rw8.urc.tue.nl
Message-ID: <7168@tuegate.tue.nl>
Source record: 211057

Hello,

I have just finished reading a book that described some of the
functions of the SCSI bus (not SCSI-2).
One of the most interesting features of the SCSI bus was "bus
arbitration". This allows drives to temporarily disconnect from the bus
to free the bus so other drives and printers and so speed up all
communication. It could possibly even allow more than one computer to
share the same bus and drives.
Can the Falcon SCSI-2 bus do this too?

Erlend.

1737. STe abilities exploitation list!

I don't know about the pro-copyright stuff, Jan, but it would be illegal to translate the book and distribute same, even if it was done for free. The copyright laws are very explicit on this and extend across international boundaries. Not that anything would likely happen, but that's the risk.

A more legal approach would be to attempt a letter writing campaign to Sybex (is Abacus their US subsidiary or not?) requesting (demanding?) an English version of the book. They might even pay attention... not!

I downloaded Powerdos from a.a, bit I can't get it to do anything for me.
There is no Configur file in the archive, & I cant't figure out how to set it
up properly.

If there is anyone out there who has or who knows something, please post a
reply as it certainly looks interesting.

Some questions:
1. Does it work with all versions of TOS.

2. What is the difference between it and Mint/Multitos.

3. How much faster are the disk routines.

4. How do you set up the programs to muti-task.

Regards

Guess what: Protext has this same capability. A copy of this software
(version 4.3, I think) is on the cover disk of the latest (?) ST Format
magazine. I was just playing with this capability the other day by
drawing boxes around a centered title. Nifty.

On a different topic, one of the best editors for the PC is Multi-Edit.
Multi-Edit has the line draw mode as well. It it fast and offers
excellent mouse support with drop down menus (similar to an ST). There
is a *fully* functional demo version of the program available (no
spelling checker, no extended programming language support, etc. but
allows almost all other functions including saving and printing files).
Screen scrolling is via mouse movement. Being a demo, it is freeware.
Your Dad should get this - he will be impressed.

IMHO, the Multi-Edit interface is a lot more intuitive than Sudden View
(with my admittedly very brief exposure to Sudden View), even though
there is significant overlap in the underlying concepts.

The Hard Disk, just like the floppies you want to read on a IBM PC, have to
be made compatible. There are several (1-3) bytes in the TOS partitin header
that have to be made right. There is a fixup program floating around from
Avent Gard to do this.(I know you can't ask them).

Also, PC Ditto only knows about 4 partitions
and the old Supra partitioning scheme.
If you use HDX 3.01 and Big partitions PCDitto will fail.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

People might like to know that the latest version of ST Blank, V2.0.1, and its assembler source have been posted to comp.(sources|binaries).a.st and uploaded to atari.archive.umich.edu. I only posted them today, so give the files some time to appear in the various places.

Changes from version 2.0.0 (posted just before Christmas) are:

1) The AUTO folder part doesn't crash if there's no .INF file
2) The dialogues have been tidied up and now look better in medium and low resolution.
3) There's an "about" dialogue as well (purely for aesthetic reasons!)

I have a TEMPEST arcade game at home and it's my opinion that it would not port well to any home computer. The main reason is the controller. TEMPEST uses a free spinning rotary knob, and I can't see how one could emulate that action with a mouse, joystick or trackball. On some of the screens it could work (the ones where your movement is essentially left-right), but the circular and figure-8 screens wouldn't translate at all.

Of course, if someone wanted to market a rotary controller with the game it would be another story...

Try using the Setup program (can't remember what it is called)
Also tru checking to see if your HD is setup to 1:1 interleave
cause if it is you've not much change of using it under DOS.

I've only ever used PD Ditto on a floppy system (Very slow)
So I'm not sure of the exact config.

This is the reason why I *do* need a font editor.

>You won't want a font-editor or conversion utility because bitmapped ST fonts
>are too crude when compared to the quality of a true vector font.

You're mixing two different things. I want a font editor because I do not
have a free APL2 font, and I don't want to buy one. I don't care about
bitmapped ST fonts. Also, I think that Speedo GDOS can also handle those.

You don't actually fight Lord Chaos, you need to use the staff, but only to cast flux cages, not as a physical weapon per say.

1753. Atari Mega ST2 (complete system) for sale

Newsgroup: comp.sys.atari.st
Date: 1993-01-28 20:13:10 UTC
From: horj@vax5.cit.cornell.edu
Message-ID: <1993Jan28.151311.17086@vax5.cit.cornell.edu>
Source record: 211117
Cross-posted to: misc.forsale.computers.other,comp.sys.atari.st,cornell.marketplace

I've decided to go the way of the PC rather than of the Atari ST; thus, I'm putting all my ST stuff up for sale. This is a nice system for playing games and doing MIDI stuff on -- ST is the system of choice for many computer musicians. For serious use, you'd probably want to add an external hard disk.

I'd prefer to sell all this together, but good offers for the components will be considered.

PRICE : $1,200 or best offer for the whole shebang:

Atari Mega ST2 -- 2 Meg RAM, single floppy (TOS in ROM)
Atari SM-124 hi-res mono monitor
Atari SC-1224 lo- and medium-res color monitor
mouse & keyboard
2 joysticks (one *very* nice Wico pistol grip, one TAC-2)
Casio CZ-1000 programmable synth (8-channel polyphony; *not* velocity sens.)

Software:
Pipe Dream Bard's Tale AC/Fortran
Oids Blockbuster Captain Blood
Populous Wargame Construction Set Marble Madness
Empire Dungeon Master Barbarian
Music Studio Beckemeyer Programmer's Toolkit (csh, make)

All software has original disks, code wheels, and not much else.
AC/Fortran and the Beckemeyer, I have manuals for.

All necessary cables are included, of course, as well as two 6' MIDI cables.

Respond via e-mail (HORJ@vax5.cit.cornell.edu), and we can work from there.

Hi,

In article <church.728187599@sfu.ca> church@fraser.sfu.ca (Mike James Church) writes:
>
>Is there a program like this for the ST? He'd like to be able to
>"paint" at home as well. Just a simple ASCII text editor that has
>a similar mode.
>

as far as I know, uEmacs ought to be able to do this. On
ftp.uni-muenster.de in /pub/atari/Editors is a recent copy of this
editor. You will need one of the macro-packages that come with uEmacs
to do the job (do not ask me, which one, I never needed to do this).
Apart from that, you will need a program, that installs an IBM-style
font in your computer. There will probably be some GDOS versions that
can do this, though I remember, I used to have a program that did this
without GDOS. For printing, you should not have any difficulties, if
you set your printer to IBM-mode.

Please be aware, that uEmacs is a very powerful editor but might not
be suited for beginners. Depending on your fathers skills, this
suggestion might not help you :-(

Still hoping, I was of some help to you

>file. (The main thing about GIF89a is that the file contains an
>embedded caption in the form of a "comment extension block."
>Files under the previous GIF87a standard just had the image.)

I added GIF89a support to MGIF, the monochrome GIF viewer (that uses Floyd-Steinberg dithering to display grayscales, written by Bill Rosencrantz). My code was added to version 3.5, but I've sent it off to be integrated into the 4.0 release, so a new version should appear soon that's got all the new bells and whistles...

> On the panel of my computer it says "Atari 1040ST" and then there is
> a tiny letter "f" right next to the 1040ST. What does this mean?

F=Floppy. It means the computer has an internal Floppy Drive, instead
of the external which the previous model had!
M=Modulator, means the machine has an RF-Modulator built in
E=enhanced. (STE). Extra paletter, Blitter, DMA, etc. etc.

Well there are plenty of DSP boards for both the Mac and the PC right now. Where is the software support? Right now you have to use the software from the company who makes the board. Until a defacto standard board evolves (ala Sound Blaster) for DSP you won't see the software support. The point is that ANY Falcon software that would benifit from the DSP can use it.

Btw, I have heard here on the net that a next generation Mac will have a built in DSP later this year. Will Apple build a plug in DSP card for older Macs that will be compatible with the built in one? If they don't will software be written to use it or is it for use by the system only (QuickDraw GX ???).

Okay... now I need SOCKETS, and the ability to eaisly NFS mount drives using a SCSI <-> ethernet adapter! I recon if the sockets are proper, that KAQ9 could avail itself of them... Running under MultiTos, with sendmail and nntp daemons, I could trash my 486-33 and OS2. (seems kind of funny.... Guess I'm a cheerleader too then....)

While I agree that Atari is in very ruff shape I would like to point out that the prices you mention are after serious discounting. Sure, I Falcon 4/65 retails for $1295, but after discounting, I expect it around $1000. Let's be practical for a minute. After the Die Hards get their hands on them and the machine begin to rest in quantity, the price will drop. How much can you get a 1 meg STe for (ans $379). It retails at $599! That is one hell of a drop. I expect the same will happen to the Falcon.

Will I buy one? I think so, bt in the two piece case. It will be the 030 configuration at 33Mhz I suppose. I know I won't be able to afford the 040. And it will suit me just fine. ANd if I can get Mac II or 486 emmulation off it, hey that's even better. For the record, I own no emmulator for my Mega ST and have never really seen the use for it. All my software does everything I need it to, and more. I doubt I will ever use Calamus SL to its fullest potential, but that's cool.

So cool. Computers aren't the end all/be all that they want to be. All the technology filtering down to us home users is already out of date. So use what you can and enjoy it for what it is. That's why you bought the thing in the first place...

I have no further communications.

You're absolutely right there! Nada music comes out of my STe.....
Anybody know if I'm not doing something incredibly wrong or is it supposed
to be like that? Oh yes, before I forget... For the robots that fly in the
air, what's the best way to kill 'em? The way I use is to run to the nearest
electrical outlet, charge up my hand, and start shooting the upper part of
the screen... This kills 'em but when I'm pressed, it seems reeeely hard to
actually find an electrical outlet..... Thanx!

Yes Apple is expected to realease DSP Macs this summer. Here's the blurb
from Murph's Vaporware Column:

****
Apple's first two multimedia
workstations (codenamed Cyclone--see last July's column) will debut in
June. These Macs will have two sets of digital signal processor (DSP)
chips and Fast and Wide SCSI. Prices of $2,500 and $5,500 are expected.
At least 25 developers are already writing software to take advantage of
the DSP chips jointly developed by Storm Technology and SuperMac
Technology. An even more powerful "media server" is expected in the
fall.
****

With Storm Technology involved you can bet that you won't have to wait
for jpeg decompression to be in the hardware. I don't know for sure, but
I would guess that Apple (or some third party) will release a DSP card for
the older Macs. Considering the Mac architecture, I don't really see a
problem for a card to gain the same level OS support as built in hardware.
And once that is done, all programs looking to see if it is present will
find it and use it. (A similar thing happens with Quicktime right now.)
This means that once you add the card it can have immediate effects on other
programs (like Photoshop and any Quicktime program). Since Photoshop is
one of the biggest users of DSP add-on boards on the mac, I really see that
being available at release time.

Of course, we still have *no* idea at how good the sound will be, and what
level of video it supports. At least one of the machines is supposed to be
an 040. Of course the Falcon is still cheaper, and it should have at least
a 3 month head start (assuming release for Falcon in March). I've just
developed a "wait and see" attitude.

I'm not disputing anything you said in your message, but one thing is worth noting: IBM clones differ widely based upon the manufacturer, and especially the make of the BIOS. Just ask anyone who bought a Tandy! What brand systems are those, and what BIOS do they use? I have owned systems with IBM, AST, and DTK BIOS, and they were all trouble-free, but I have hrxxx heard of pronblems with some clones. I don't know, but AMI is also supposed to be good.

I wrote an Amiga version of it for the June 1992 issue of Compute!
(AmigaResource)

If you can program in assembly, it should be easy to move it over to the
Atari.

It doesn't use any Amiga specific libraries and the only thing you would have
to do is make atari display 3 384*384 bitplanes (can be converted to 640*400
by changing 2 constants), rewrite the code that uses the blitter to
draw lines, rewrite the lines that start the sound playbacks, remove
the code for the title/demo screen since it uses the copper to display more
than 8 colors, replace any entry and exit codes, and the lines that
read the mouse port.

Unfortunetly, the only Ataries I see are on TV (Some "business school"
shows some lady learning wordprocessing on a ST) so I can't do it myself.

p.s. The code belongs to Compute!, you should get their permission before
changing it.

>prices possible.

I'm most illiterate regarding ethernet hardware stuff, but
reading this, a weird question comes to my mind: Would a hardware
hack be possible that allows using a PC ethernet card on an
Atari? Years ago, when hard disks for STs were a real big deal,
there was a "cheap solution" developed by the c't magazine, for
using certain PC hard disks with an ST, so ST owners could
benefit from the more affordable prices for PC hard disks. Maybe
we can once more take advantage of the mass market prices for PC
peripherals in such a way?

Could some hardware guru comment on this, please?

Source record: 211134

I've recently purchased an unmodified 1040 STf for my father and younger sisters to use as a word-processor and so forth. It currently has TOS 1.0, and I would like to purchase a small, preferrably used, hard drive for this computer (it currently has only 1 double-sided drive). My father is unwilling to shell out much cash or I would suggest a new/larger drive. If anyone has a used drive for sale, please let me know what you would want for it.

also: I installed WordUp 3.0, and have it working fairly well. Unfortunately, in the process of moving at some point in the past I have misplaced the manual. If anyone has WordUp 3.0 for sale my father would be happy to purchase it (including the manual). Since the company is now out of business I have also had no luck in finding laser-printer drivers for this program (TurboJet). If anyone has TurboJet 2.0 or newer for sale, or knows where I can purchase this, please let me know...

Finally: This machine sometimes runs into the "40 folder bug". Unfortunately, FoldrXXX.prg *CRASHES* the machine upon loading! This is very annoying! What other options do I have?

Finally Finally: If anyone has a memory upgrade or newer ROMS that would work in this machine and wants to get rid of them tell me the price you would ask and I'll see what he says.

Thanks!

Ken,

I don't know if you missed it, but in the conneng.txt file, it
describes how to make CoNnect English-user friendly. All you have to do is
to move connect.rsc out of the connect directory (or delete it) and rename
the conneng.rsc file to connect.rsc. Doing this will make all of the menus,
etc., into english. In fact the only thing that will not appear in English is
the manual (and soon even that will appear in English :). Also, you can remove
any of the sliders to give you the extra room you need. Using the included
Fonts, you can use a font that is decently readable while still giving you
80x24 screen (to do that, just put the ANSI and ANSILITE fonts in to a folder
called GEMSYS in the same directory as CoNnect).
It is a bit slow, but that can be fixed with a screen accelerator
like Warp9 or NVDI.

There was a place in the Roger's Park area called Software Plus. If there're still in business you should be able to find them in the Yellow Pages.

For clip art, take a look at mac ftp sites. They seem to have lots
of clip art for the mac. The problem is they're in HQX (Like UUE) format.
You've to use something called xbin. Its available in C source code as
xbin.shar.

1776. NetHack 3.1

Newsgroup: comp.sys.atari.st
Date: 1993-01-29 07:48:41 UTC
From: hmallat@robin.cs.hut.fi
Message-ID: <1kangpINNsun@sauna.cs.hut.fi>
Source record: 211080

Looks like NetHack 3.1 is here! The sources have started appearing in comp.sources.games, and I was wondering if someone would be kind enough to compile it. The source look *huge*! I have just 2 megs of memory, and we all know how awesome GCC's demands are, don't we?

So, if anyone was kind enough... anyone?

Here's the announcement that was in c.s.g. a few days ago:

[This is pre-announcement of the impending post of NetHack 3.1. The following info describes some of the enhancements in more detail. This will be a *huge* post - on the order of 100 parts - and will take place over several days. Please wait until everything has been posted before sending requests for email or reposts of missing parts. Also, check your neighboring systems or the c.s.g. archive sites for any parts you're missing. Bugs should be sent to the address listed in the README file - not to me. Thanks, too, to the NetHack development team for their efforts. -br]

NetHack 3.1 is a product of two years of intensive work by the NetHack Development Team and its Amiga, Atari, Macintosh, OS/2, MSDOS, and VMS ports sub-teams. These include over thirty members from different countries. The team wishes to express its gratitude to the management of linc.cis.upenn.edu for its generous support of this unique development activity.

NetHack 3.1 is a new generation of NetHack. Here is a list of some of its main new features:

* Unlike 3.0, NetHack 3.1 is a multi-dungeon game. New dungeons "branch" off the main dungeon at different locations.

* A unifying mythology was adopted for the game. There are tasks which must be completed in various dungeons before the main task of capturing the Amulet can be undertaken. There are different quests for the different character classes.

* There is a new multi-level endgame full of surprises.

* Many of the monsters in NetHack 3.1 now can wield weapons, zap wands, read scrolls, and cast spells. Fighting them must take these special abilities into consideration.

* The game's display was completely re-written. It is now based on a line-of-sight principle, and it gives a new "feel" to the game. The new display was written with a standardized window interface, which allows easy substitution and addition of windowing systems independent of operating system. For example, the UNIX port now supports X11 as well as the traditional tty.

* Numerous local changes were made, and many new monsters, objects, and intelligent artifacts were added.

You will discover the details and the rest of the changes for yourselves.

As we did with 3.0, we will periodically release patchlevel revisions of NetHack 3.1, which will include bug fixes and further development results. Avoid applying free-lanced patches, if you want to take advantage of these patchlevel updates.

Despite our effort, there are, no doubt, many bugs still in the code. The Amiga and Macintosh ports, in particular, still have rough edges due to time constraints on their port-team members. A port to Windows NT is underway but is not suitable for release at this time. We call upon you to help in debugging both the game and the ports. The address of the NetHack development team remains nethack-bugs@linc.cis.upenn.edu.

As always, your comments and suggestions will be appreciated. Enjoy.

--- and another article in c.s.g...

A compressed tar file of the entire NetHack 3.1 tree has been archived at two locations:

(East) ftp.uu.net ~ftp/usenet/comp.sources.games/nethack31.tar.Z
(West) ftp.world.net ~ftp/pub/games/nethack31.tar.Z

[There was a problem with the early versions, so if you ftp'd it prior to 28 Jan, you should get a corrected copy.]

If anyone copies these to other archive sites (especially outside the US), let me know so I can post the info.

In about a week, linc.cis.upenn.edu will update their archives with split tar files of 3.1. The archive on linc is organized by system architecture, so you don't have to get the architecture specific files for systems you don't want or need.

As always, the regular comp.sources.games archive sites will have copies of what is posted (i.e. the 108 individual shar files).

$169 (+59 for case, including a 200watt P.S.)

>4mb RAM (minimum) $160

$128

>IDE board $35 (w serial, parallel, game)

$17

These are REAL prices.. I just bought them this week.

(and the 386DX, 40Mhz, 64K cache, upgradable to 486 motherboard had
BOTH it's CPU and AMI BIOS chips included... :)

I think the most important point is that I was able to walk into
a local computer store and buy these components (or a complete system
had I wanted one) right NOW.

Note.. this is NOT to say the "Falcon sucks".. until I actually see
one, and have a chance to actually use one, I'm reserving my opinion.

But, THIS is the real world... not a "someday" computer.

The point that's being forgotten in all this talk about the PC's DX2 "speed doubling" is that this is exactly the same way the Mega STe is a "16 Megahertz" computer, and the TT is a "32 Megahertz" computer. The Mega STe runs at 8 Mhz external to the CPU.. the TT runs at 16Mhz external to the CPU...

If the Intel approach is to be considered "marketing flim-flam", what does that say about these Atari machines..?

"Bigotry" goes both ways...

This is no GDOS problem.
Each graphic card has to have one (or more (correct)) VDI driver.
Most cards I heard of have this driver (NVDI for ET 4000 for example).
If your card hasn't throw it away.

Well there is several solutions to that. You could always take the
hard disk out of the Atari and install in the 486 machine but this
would cripple a great machine.

We had a simular sort of think here where we wrote a serial server
for the megas. However it was not perfect and tended to be a bit
unreliable.

There is several other systems tried ka9q for slip? you could batch
the slip requests ?

One thing I'd like to see is a picture converter that can
convert pics from *ANY* format to *ANY* other.
For example from Targa to Neo, or backward.

I know there are already a lot of such progs but they usually just
trade with a few formats.

Instead of writing a full program, maybe would it be possible to write
some sort of shell using existing programs, like some desarch shells.

Isn't it a good idea :^) ?

^^^^^^^^

Eric Schwartz's animations are NOT IFF ANIM's! they are produced with the program Movie Setter by Gold Disc, and work by animating characters on backdrops, and also contain all the sound data for the animation. They do not load into standard Amiga Anim packages (eg DPaint), and if converted to anims by saving the frames they would be huge. I have a copy of Schwartz's Anti-Lemmin' demo (Widely regarded as one of his best) and this lasts around 150 seconds, comes on two 880K disks and requires 2 Megs minimum to display. The same file an ANIM would require a lot more.

Hurah! A sensible discussion on the Falcon/A1200! Thanks to Bull for being the first Amiga user in ages to appear on this newsgroup and NOT get added to my KILL list!

My house-mate bought a 1200 a couple of weeks ago and we've had some interesting results. It seems to depend A LOT on programming techniques. He's currently writing his own version of BASIC (very GFA-like and pretty impressive!) and his routines seem to perform much quicker than on his 500.

But running Hisoft BASIC (compiled!) scrolling and such are incredibly slow! There's little to distinguish the new machine from the old one!

I suspect that there are bits left in the AmigaDOS kernal that are still using 68000 code and doesn't use the extra capabilities of the machine. And there's a big point. Unless the operating systems that drive the new computers are written well, we won't see anything of the power increase possible.

David.

Hi.

I tried asking this question in another Atari conference but got, at best, sketchy answers.

I've heard that there will be a PC 486 motherboard available for the Falcon within the next six months..

Is this true? The rumours "state" that you'll be able to run any PC software on the Falcon and that you'll be able to switch between DOS and Gem at the flick of a switch....

Any views?

Craig

Those who've owned an Atari 2600, particularly in the early days (1979...) will remember that Atari had released a controller similar to the paddles. The paddles, of course, could only turn so far to the left or right.

However, if I remember correctly, I think they also released a controller that looks like a paddle, but turned all the way around. I can't remember if what the exact name of it was (my mind says "driving/steering" controller, but I know that's not the name of it). It's been awhile since I've used my 2600, so you could probably understand my amnesia on this. If anyone else can elaborate or remember this controller...

And since the ST/ST/TT/(Falcon?) series use controllers compatible with the old 2600 controllers, I could see someone setting a Tempest clone to work with it. Actually, they should probably allow the user to use their choice of controller, since some are easier to get than others...

Was an awesome game, though...

>information, Holland has 15 million inhabitants, and hardly any other people
>on the world (OK, another 30 million?) read Dutch.

You shouldn't forget your neighbours in Belgium...

In my opinion the whole discussion is useless. It is a fact that the current lates edition of the "Profibuch" is available only in German. This means that to get an English version, somewhat would have to translate it, which costs money. It doesn't help to point out that it might have been better to publish only an English edition, since this decision would have to have been made much earlier.

The main question when deciding about whether or not to translate anything is "How many people are likely to buy the translation?". This question is related to, but not identical with, the question "How many people in the world would be able to read it?".
The reason that a Dutch translation seemed worthwhile some time ago, whereas an English one might not now, is probably that
1) The number of serious Atari users is decreasing.
2) The proportion of serious users among all Atari users is much higher in the Netherlands than in the English-speaking countries.
The second observation is definitely true, the first one probably also.

>hopefully searching for certain information if you want. Dunno, just
>a thought anyway.

There are two programs I have considered writing myself for a long time
but haven't got around to:

1. Universal file unpacker. Ideally you would point it to a directory of
files in ANY packed format (ZIP, ARC, LZH, TAR, compress, uuencode), or
even raw news articles, and it would unpack each package in a separate
directory. In principle this isn't too difficult; I a have a collection
of MSH scripts that come quite close, but doing it reliably without
any user interaction is still tricky. And a nice GEM interface would be
useful too.

2. Notes file database. I have a large collection of saved news messages,
and I've considered for a long time to make a database for this.
That is, I would shovel in all these messages, and the program would
somehow allow me to find notes that contain certain words or have
certain keywords associated with it.

It should be possible to create a new message, edit existing ones,
etc.. This program is difficult. At last count the size of my notes
file directory contains 2MB of messages, but it could easily increase
a factor four or five. Creating an efficient keyword database for such a
database is difficult, I don't think that normal database programs are
suitable for this task.

>all.

I disagree. The knob only acts as a screen translatable controller.
It's the orientation of your 'ship' which determines which way is what,
especially during the figure 8 patterns where the knob control does not
switch at the center (if I remember correctly). In any case, it's
just a matter of training. The mouse would at least give incremental
control where a joystick would move only in a very restrictive linear
fashion.

Besides, I'm prone towards games I can just power up from my desktop
without having to fiddle with installing a joystik or trackball.
The question is moot until such a program exists though. Any of
you bright-eyed, assembly language gamesters interested? Would it
help if I said it don't exist for the Amiga yet?

Is all.

You could stick with FONTGDOS and use one of the GDOS font editors. At least one GDOS font editor is available on the atari.archive.umich.edu FTP server.

If SpeedoGDOS is anything like FSMGDOS, you may be able to use typical GDOS fonts, but you won't be able to use any of the SpeedoGDOS features with these bitmapped fonts -- a bitmapped font is not scaleable, except in the crudest form.

Since BitStream fonts are licensed technology, I don't think you'll find any freeware or shareware font editors for BitStream fonts. You might be able to find a font editor within the Intel-clone world of software. Good luck in your search.

It's pretty unlikely! It crashes horribly on the TT! (the one I saw
anyway). It uses all sorts of fancy tricks to do what it does, and so
running on the Falcon is unlikely. Any-way, who uses CGA (or whatever
PC-Ditto emulates) these days!? And it's slow, Compo's 486 Emulator
Card just plugs straight into the Falcon, and gives you VGA graphics
(with no need for tricks), and runs at full-speed! (Probably 32Mhz or
some such thing). This is perfectly acceptable, so you can even
(if you have lots of RAM and HD space), run Windows, and Wing COmmander 2!

Well,

Compo showed off their 286 emmulator at the Comdex show and siad that the
486 was in the works. They did not mention why they were skipping the 386...

I am planning on getting the Mega Falcon when it is released so I will wait
until then. And hey, if I can get 486 or MAC II emmulation, well then that's
great too.

>>all.

(uh, I forgot who made the original posting - whoops - so just a reply
to whomever that was (all those ">"'s get confusing after awhile :-)

One thought on the controller. Ever play the game GYRUSS in
the arcades? The movement of the spaceship in gyrus was similar to
the movement in Tempest. However, in Gyruss you actually used
a joystick. It *did* take a little getting used to, but wasn't
bad after awhile...

Everyone is now talking about local bus PC's now, but they haven't even
taken advantage of the 16 bit bus on some (make that most now) graphics cards.
For sending commands, all VGA cards, no matter what they say in the
manual is still an 8-bit graphics card. What a waste.

>There is no Configur file in the archive, & I cant't figure out how to set it
>up properly.
>
>If there is anyone out there who has or who knows something, please post a
>reply as it certainly looks interesting.

I'm the one that's guilty of posting it. I used to have a configur
file, but it got trashed in the "Great Hard Drive Crash of 1992".

>Some questions:
>1. Does it work with all versions of TOS.

It does NOT seem to be compatible with MiNT. I haven't had a chance
to check it with 0.99, but as of 0.96, it would cause serious "crash
and burn" if you tried to run them together. No hard drive damage,
but the computer WOULD crash.

>2. What is the difference between it and Mint/Multitos.

They have somewhat different purposes; PowerDOS provides a replacement
for GEMDOS, whereas MiNT replaces (pretty much) all of TOS.

PowerDOS, if installed with a large enough cache, GREATLY improves the
performance of hard drive activities. It also provides "hooks" by
which you can easily run a LAN.

MiNT/MultiTOS is designed as more "general" tools, and leave the
device drivers to XFS systems, or to GEMDOS.

In theory, you could run 'em both, and get the best of both worlds.

The really quick way to describe it is:

PowerDOS is an optimized device driver, and by virtue of the
networking system, allows a certain degree of multitasking with
specially designed programs;

MiNT/MultiTOS is a general multitasking operating system.

>3. How much faster are the disk routines.

It gives somewhat better performance than the ICD drivers; it's pretty
good.

>4. How do you set up the programs to muti-task.

Check the README/.TXT/.DOC files. That's all I can think of, offhand.

The sound effects that I get with my STe aren't much different than what you describe although there are stereo effects than are kinda nifty. No music to speak of though.

Another useful device is the mapper which will map the dungeon for you as progress through it. By the way, does anyone know what use the power sapper is (other than killing off your energy supply), or is it just a red herring.

The problem with the Amiga is in reference to processor intensive items (Flight simulators, etc) that require the use of 3D graphics. The Amiga chip set is great for things like sprites, but the moment you start doing 3D Graphics, you have to start using the processor to calculate all the Transformations. A flight simulator will spend a good portion of its time figuring out where to draw its objects, not drawing them. This discussion is in the end really pointless though, both computers have their good and bad points. Personally, I can't stand looking at that blurry screen for more than 5 minutes.

>said that you can't use it on the 520's and up but I can't figure out why.

You can't use those in the ST series because (I am told) they are
actually analog controllers, not digital controllers. You CAN,
however, use the driving controllers that came with Indy 500, which
would be better for Tempest anyway since they turn a full 360
degrees. I've used the driving controllers successfully in a quick ST
port of Indy 500 -- much better than joysticks, but hard to find these
days...

I thought this at first to, until I started looking for software. I use Microsoft Works, which retails for $149. Now its a little more expensive than say, Wordflair II ($119) but it is a lot more useful. I can save my document onto a disk, walk to the computer lab, and print it out with no problem whatsoever. (If Wordlfair II could save in some sort of standard format, like Word, Wordperfect, or Works, I would've bought it in an instant!)

It was a steering controller, released with a driving game cartridge.
Long time ago, I hooked it into my 8-bit and it seemed to read

similar to a joystick, and not a paddle, so logically, it MIGHT work on the ST. Try it and See :)

Yes, Tempest did come out for the ST. Atari released it back around
1988 or '89. I have it and its just like the arcade game. I don't know
if Atari still sells it but you might try them.

> I've heard that there will be a PC 486 motherboard available for the
> Falcon within the next six months..

The company 'Compo' is making it (should be just about, if not completely,
finished by now... Probably in beta-testing...)

It emulates a VGA-486 almost flawlessly. And should enable you to run
anything that will run on a stock, VGA graphics-IBM-compatible 486
machine!

There should be some more informed info' in an upcoming Z*NET or AEO
on-line magazine I'd imagine! (next 3 or 4 weeks!? 8-)

Mac emulation is also in the works - the famous Dave Small is working
on it.... Information about capabilities is almost non-existant.
As it is a family business, leaks don't escape very easilly! (Which
means it's going to be easier for Dave to do what *he* wants to do,
the Spectre GCR was a marvel of technology, the Spectre-4 should
be great!!)

> also lies within the mag as there is a special offer on the manual.

Which magazine!? The original of the program was released approx'
1 year ago! Why on earth would they release it that soon!?

STOS itself was released. And neither are 'PD', they are still
fully copyrighted. (but with stuff all documentation, so the company
in effect should make more money through sales of the doc's than
they would selling the rather failed program. STOS-3D is not too
nice, powerful, but the object editor is horrible!)
(No I don't own it, some of my friends are STOS addicts, and own
just about every extra etc. for the thing. Including STOS-3D, which
doesn't look bad - but as I said, has a not-too-good 3D-object
editor.)

If you do mean STOS-3D, which magazine, and which issue!? As I get
the left-over magazines from a friends-aunt who owns a newsagent...
(great!! Saves mega-$$$)

1839. What's the F in 1040STf

Newsgroup: comp.sys.atari.st
Date: 1993-01-30 05:42:46 UTC
From: phruby@ucrengr.ucr.edu
Message-ID: <25610@galaxy.ucr.edu>
Source record: 211188

The F on your computer stands for frequency modulator. Basically, this means you can connect your computer to a TV or VCR. Early 1040STs did not have this capability. (As I remember.)

Paul Hruby

1840. A proposal to Developers/programmers

Newsgroup: comp.sys.atari.st
Date: 1993-01-30 06:43:07 UTC
From: wilsont@rahul.net
Message-ID: <C1nMnw.9pI@rahul.net>
Source record: 211179

After taking a look at the myrads of compatibility problems, and a lack of
standards for certain areas of TOS/MiNT, I see a need to compile a document
that outlines:

1. The best compilers, what libraries to use...
-The language end of the program.

2. "official" or creation of a 'defacto' standard for fonts,graphic images,
sound formats, and text files.
(Fonts: Bitstream Speedo, Pics: GIF or Targa, 16bit signed sound w/ stereo
interleave, and for text, ascii and 1st word?)

3. the clipboard, (include the atari document), and with #2, cut down on the
need to support so many formats.

4. Programming techniques. (kinda broad I admit...)
-Run programs in windows
-Don't waste an ACC, use a CPX if possible.
(when to choose, and how to write a CPX)
-Use VDI to get screen colors and dimensions, not Getrez()
(that type of stuff, with examples)
-make it run out of a directory, not root, and not A:

5. Multi-tasking and 32bit CPU's
-Don't lock out other apps with a wind_update(BEG_UPDATE) forever.
-Don't use the high word on the adress registers for data!
-When to choose a ACC over a background process.
-How to write a TOSWIN compatible TOS/TTP program.
-Never assume clock speeds, use the real-time clock.
(again, examples for each of these)
-a standard for "drop document on running apps"
(does this really exist?)

6. But I write full screen fast arcade games....
-Ok, but do it right, don't assume the screen is in the host ram.
-if possible, don't completely take over the computer
-warn the user :" i need at least 80% of the CPU to run properly"
-use a big window to cover up the desktop, a pause should give the
menu bar back.
-don't use custom loaders, or lock out the reset.

Well, thats some of the ideas and headings I would have.
Many more can be added, and I hope they are.
I would hope to see such a document eventually distributed via the IAAD or in
the developers kit.

I feel this would help us all out, I don't like stuff that bombs out just
because I have 1.06, or a hard drive.
I've seen stuff blow up cuz i switched on my modem!

I do not propose a hard-core do or die standard system (like the Mac),
but "strongly recommended" ones.

Perhaps a black list of "unfriendly" companies, programs and developers would
also be apart of this? (problems might arise here... feedback!)

If you have comments, hate mail, or additions please send them to me!

Send your submissions to wilsont@rahul.net.
I might be able to get a FTP area as well.

(if this has already been done, where is it?)

Jan, these even made it all the way here to New Zealand (grin). But
you raise a good point.

The controllers from C'T were a 50way IBM slot and you can infact
plug an ethernet card in them (NE2000 or anything), I wonder if they
they would release the tech specs on the card and source code for
the 'omti adaptor' ? If so I suspect a port of the Clarkson Packet
drivers would drive the card and with ka9q you have a full IP
system.

Just food for thought

Cheers from New Zeeland

That's wrong. There is at least two FAX progs more around... but they are German, and I think one of this programs has an acc that is public domain. With this you can send fax from a program that has a fax driver... Not many has yet, but...

You get a CONVERT.PRG with the various Replay cartridges (also from Microdeal) which will conver between AVR, SPL, SAM, STOS and allsorts. I'm suprised it isn't included with Stereo Master!

I always thought the F stood for "floppy" and M stood for "modulator" as I have a 1040STF which has no TV output at all, just a monitor socket. The STFM came out afterwards and then the STE.

Craig

1849. running Mint

Newsgroup: comp.sys.atari.st
Date: 1993-01-30 18:47:56 UTC
From: jhp@sactoh0.sac.ca.us
Message-ID: <1993Jan30.184756.17298@sactoh0.sac.ca.us>
Source record: 211155

I've managed to get Mint installed and everything seems to be ok. My question is, what do I do next?

I can open a TOS window then I'm asked to run a program. I select tcsh.ttp and then the box appears asking for parameters. I hit return and the shell runs. I'm not sure if this is right. BTW, when the program asks which program to run, it sends me to C: instead of D:, which is where I have Mint installed.

After the running of the shell, I can't appear to do to much with the thing. I can do an "ls" but that's it. I can't run gcc or anything else. I don't end up in my user directory either.

These are the big problems right now. Any and all advice is greatly appreciated.

>
> Paul Hruby
>
My 1040STf doesn't have a frequency modulator. I bought the 1040STf from
the dealer based on the single fact that the manual said that it did have
a frequecy generator. When I bought the new machine (still had the pilfer
proof tape in tact) I didn't verify this fact. Two months later, I tried to
hook the 1040STf to a VCR and I discovered that the composite output
promised by the dealer and the manule just didn't exist. When I called the
dealer to fix the problem, the answer was "Atari ST's; we used to sell those
things, but I don't know much about them. Maybe you should buy a Commodore
128. That should fix your problem."

So maybe only some 1040STf's really have the RF modulator.

If WordFlair doesn't save in ASCII format, then it stinks. WordPerfect can
easily import ASCII files -- I do all my papers this way.

>not have this capability. (As I remember.)

No, early ST's have the tiny 'F', and it means 'floppy internal'; the letter 'M' was used for 'modulator'. The 1040 STFM has an RF modulator, my earlier 1040 STF does not so I bought something called VideoKey from Practical Solutions to get TV and VCR output.

:EMILY: ??.??.??
Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of _humor_.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways), Emily has taken time out of her busy schedule to answer a few commonly asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.

Flame wars are fun. They're the main reason people creted Usenet,
and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV: ??.??.??
How do I become a developer for the Atari ST?
==========

Contact Gail Bacani, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7

Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5
Invalid handle.....-37.....6
Insufficient memory.....-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46.....15

```
No more files..................-49...........18
Range error....................-64...........33
Internal error.................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

:FREE: ??.??.??
What is Free-Net and how can I get access?
=========================================

A "Remodeled" Atari S.I.G. Opens
```

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG

P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

:MAGS: ??.??.??
What magazines are available for the Atari ST?
==========

If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.

As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby <kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011
Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so polished. 2 cover disks per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Bretonischer Ring 13, 8011 Grasbrunn, West Germany, Phone: ++49 89 456 160

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French Mags:

ST Magazine

Monthly in French. Oriented towards developers, professional users. Comes with a disk each month.
ST Magazine - 10, rue Hegesippe Moreau - 75018 Paris - France
(French Teletel users: 3615 Teletel access, code STMAG)

STart Micro

Monthly, includes a cover disk. 11 issues per year. 64 + 16 (separated) pages.
Price: FF38 per issue, subscription: FF360. Subjects: Desktop publishing,
graphics, initiations to C and GFA Basic, survey of outcoming software, music,
folders. Minitel access: 3615 code ATARI. Address: FC Press, 57 rue Danton,
92300 Levallois-Perret, France.

Dutch Mags

ST, published by Stichting ST , postbus 11129 2301 EC Leiden the Netherlands
---
cover price: fl 6,95
Independent magazine by and for atari ST users.
covers all different topics from applications to games and hardware.
60 pages.

6 times a year. One year subscription fl 35,-
black and white pages.

START, published by Divo , M. Gijzenburg 14, 2907 HG Capelle a/d IJssel
---
cover price: fl 7,50 (may be more now)
All round magazine, floppy-service available for published programs.
68 pages. 2 color print

6 publications a year. One year subscription fl 39,95
including floppydisk fl 119,95

Atacom, by Atari Club Groningen.

Never seen this one. I suppose you have to be a member of the club or so.
price is fl 4,95.
Adress of the club: Atari Club Groningen, Postbus 9164
9703 LD Groningen, the Netherlands.

Atari Nieuws, by Atari ST computer club Nederland

News paper sized publication. Lots of colour on newspaper pages. Not too many
pages though.
price is fl 3,95 (cheap cheap)
monthly publication.
adress: ACN, Postbus 5011, 2000 CA Haarlem, the Netherlands.

GFA-info, by GFA gg (usergroup)

Publication of the GFA-basic usergroup. This group has a lot of mainly
educational software available.
price is fl 5,00

adress: GFA gg, Frankrijklaan 14, 2034 BA Haarlem, the Netherlands

ST News, by Stichting Computers Eindhoven

This is an electronic magazine. It has been around for about 6 years now
and is completely in English!!! The first issues were in Wordplus format
back in 1986 but from the 6th issue on it included a readerprogram
both for color and monochrome. Even with music.
price is fl 10,00
adress: S.C.E., Kornoeljelaan 22, 5552 RC Valkenswaard

:TIPS: ??.??.??
TIPS AND HINTS from other users
==============================

Any 'multisync' monitor which handles 70 video fields a second can be used
with the ST; the custom cable involves no tricks, or commercial ones are
available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are
tricky.

An ST-formatted disk which is not readable by a PC can be made readable by
putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning
of the boot sector (sector 1 of track 0, I believe). This can be done with
either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and
higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced
by ST formatters. On those drives, ST-formatted disks are not readable,
independent of their boot sector contents. The other way, however, does
always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access
a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick
extender cable will make life easier. The Y-cable joystick extenders make
it extremely easy to keep mouse and joystick connected to port 0, and a
joystick extender cable in port 1 makes for easy hookup after you've moved
the machine.

BARREL is a program which can redirect printer-data to a file. It comes in
handy when your printer is unavailable, and the program does not already
have an option to 'print-to-a-file'. (It is available on the atari.archive
server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to
drive B. Handy when a program 'hard-codes' the data drive, and you
wish to use your hard drive instead. (It is available on the atari.archive
server.)

On the Desktop of TOS 1.4 or higher, holding the right mouse button allows
you to manipulate files in other windows. This is useful for a number
of reasons. An example is this: say D:\BLAH.ARC is a file you would
like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then

hold the right button while double-clicking ARC.TTP in an inactive window.
(I've been told this will work on 1.2, and possibly other TOSi.)

:ZNET: ??.??.??
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR: ??.??.??
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

Atari Explorer Online and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

:PD: ??.??.??
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@spud.hyperion.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu, jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP: ??.??.??
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

:COMP: ??.??.??
Atari-related companies
==========

This is a (still under construction) list of companies and addresses that
might be of use to Atari ST users. Please send me addresses for the blank ones
on this list. See also IAAD, it lists many more companies that are not on
this list.

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Entries are dated by the last change. ??.??.?? means they were last changed
before the dates were added.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

WEL Welcome to comp.sys.atari.st

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.
```

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS: 93.01.30
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC, .ZIP and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ZIP Use UNZIP.TTP or STZIP.PRG
ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

stzip21.lzh - STZip, with GUI interface

unzip41.lzh - Old version of unzip

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using
zoo21.ttp.

:MSA: ??.??.??
Some info on Magic Shadow Archiver
==================================
(This was provided by Chris Herborth)

MSA Archives

The Magic Shadow Archiver (MSA) is a disk archiving program that allows an entire disk to be compressed into one file for transmission. The Magic Shadow Archiver (in shadow.[arc?|lzh?|zoo?] on atari.archive.umich.edu in ~/Archivers) creates .MSA files, which are often compressed using a normal archiver, such as zoo or lharc.

Magic Shadow is notoriously bad when used on a 1/2 meg ST and only one floppy drive. Its disk access and memory use are very badly thought out, and could result in over 160 disk swaps when unpacking an 80 track, double-sided disk.

Due to the fact that it was the _only_ disk image archiver around for quite a long time, Magic Shadow is the de-facto standard for creating disk images of computer demos and other pieces of software that cannot be easily compressed as files.

Because MSA files are disk images, they can only be used to recreate a floppy disk. There is (currently, see below) no way to extract the files from an MSA archive without writing it to a floppy disk.

Magic Shadow works perfectly with any legal TOS floppy format, even high density disks found in modified STs and most MegaSTes and TTs.

Chris Herborth (herborth@pinot.waterloo.ncr.com at work,
cherborth@semprini.tdkcs.waterloo.on.ca at home,
C.HERBORTH on GEnie) is writing a much more efficient MSA extractor, called UnMSA. UnMSA will minimize the number of disk swaps, and speed decompression considerably.

Daryl Richards (no email address, yet) is working on an MSA-Mounter, which will allow someone to unpack an MSA archive to RAM or a file on a hard disk. This uncompressed disk image will then be added to the system as a logical drive (much the same way a RAMdisk adds a drive to the system). MountImage on the Mac is an example of the way MSA-Mounter will eventually work (MountImage is so good, you can install new versions of the Mac OS using floppy disk images stored on your hard drive).

:CLI: ??.??.??
What Command Line Interpreters are available?
===

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6

```
Unknown media...................-7
Sector not found................-8
No paper........................-9
Write fault.....................-10
Read fault......................-11
General error...................-12
Write protect...................-13
Media change....................-14
Unknown device..................-15
Bad sectors on format...........-16
Insert other disk...............-17
Invalid function number.........-32............1
File not found..................-33............2
Path not found..................-34............3
No handles left.................-35............4
Access denied...................-36............5
Invalid handle..................-37............6
Insufficient memory.............-39............8
Invalid memory block address...-40............9
Invalid drive specified.........-46...........15

No more files...................-49...........18
Range error.....................-64...........33
Internal error..................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

User Interrupt Vectors......64-255
```

```
:GDOS: ??.??.??
What is GDOS, and where can I get it?
====================================
```

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available commercially from Atari. It is currently included with WordFlair II. FSMGDOS uses scaleable fonts - you do not need to create a font file for every point size. Current word is that the street price for FSMGDOS will be about $50. The Lucida font family comes with FSMGDOS, and the output is very nice, even on a 9-pin Epson printer. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

```
:GNU: 93.01.30
What GNU software is available for the ST?
=========================================
```

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.3.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM: ??.??.??
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX

Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG: ??.??.??
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the Atari ST. Programmers seem to flock to the Atari ST, and if you know of a language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME
SIOD
Smalltalk
XLisp

XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX: ??.??.??
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT: ??.??.??
What is MiNT?
==========
MiNT is a free multitasking operating system extension for TOS. It is somewhat like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM

program along with a lot of character-based programs simultaneously. MGR and MW2 can both put multiple terminal windows on screen, and bgacc can put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go with it can be found at atari.archive.umich.edu:/atari/mint.

TOSWIN is the new replacement for bgacc: it provides lots of nice features like variable fonts, menus, selectable window gadgets, etc. GEMTERM is a similar package (it's not part of the standard MiNT distribution) modelled after TOSWIN and XTerm.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now 'MiNT is Now TOS'. :-)

:XWIN: ??.??.??
Is there a version of XWindows for the ST?
==========

Currently, there is no XWindows port for the ST. It is quite unlikely that there will be one, although you are free to port it if you like :-). There does exist a port for the TT (and presumably Falcon) as part of Atari's Unix distribution.

:DEMOS: ??.??.??
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from atari.archive to allow this.

:PAINT: ??.??.??
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett. The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD: ??.??.??
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP: ??.??.??
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

:TEX: ??.??.??
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the atari.archive server under /atari/tex. Fonts and device drivers (including one for the Epson 9-pin printers) are available on the atari.archive server.

The latest version of TeX (3.14) has recently been made available on the atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the minimum files needed to get a working TeX/LaTeX system up and running on the Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0. This consists of 8 disks full of TeX stuff, plus an installation program that takes care of the details for you.

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments, suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for compiling most of this FAQ.

comp.sources.atari.st ! uuencoded/shar sources

:MODELS: 93.01.30
All the models in the ST line
==========

This is a pretty complete list of all the ST/TT models and their main features. If you have any additions/correction, of course, send them to me.

Feature key:
CPU's:
8 8 MHz 68000
16 16 MHz 68000
16/3 16 MHz 68030
32/3 32 MHz 68030

RAM:
/1 128kB
/5 512kB
1 1MB
2 2MB
4 4MB
S SIMM slots for expansion

Built-in:
F Floppy
M TV modulator

Extra:
AV 8 bit digital stereo audio, 4096 colors, hardware scrolling, analog joystick ports
MB MegaBus processor-direct bus slots
6U 6U VME bus slots, second serial port
FC Motorola 56000 DSP, 16 bit stereo audio, much enhanced video

TOS:
Highest built-in TOS

Models:

Name	CPU	RAM	TOS	B.I.	Extra	Comment
130 ST	8	/1	1.0	M		Never marketed
260 ST	8	/5	1.0	M		
520 ST	8	/5	1.0	M		
520 ST+	8	1	1.0	M		
520 STm	8	/5	1.2	M		
520 STfm	8	/5	1.2	FM		
1040 ST	8	1	1.0	FM		
1040 STf	8	1	1.2	F		
1040 STm	8	1	1.2	M		
1040 STfm	8	1	1.2	FM		
Mega 1	8	1	1.2	F	MB	

Mega 2 8 2 1.2 F MB
Mega 4 8 4 1.2 F MB
STacy 8 1 ??? F Laptop
STBook 8 1 ??? F Notebook
520 STe 8 .5S 1.62 FM AV
1024 STe 8 1S 1.62 FM AV
Mega STe 16 1S 2.06 F AV,MB,6U
TT 16/030 Just for developers
TT 32/030 S 3.06 F AV,MB,6U Various mem/HD configs
Falcon 16/030 S 4.?? F AV,FC Many enhancements!

:FALCON: ??.??.??
What are the specs on the Falcon?
==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

:ACCEL: ??.??.??
Hardware Accelerators
=====================
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM slot
68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:DRIVES: ??.??.??
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:

```
-------------- ----------- ------------ ----------
| MFM drive |------->|ACB 4000 |------>| ICD |------>| ST DMA |
-------------- ----------- ------------ ----------
```

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put
the drive internally, you will need a case with power supply to house the
adapter and hard drive. IBM case is very easy to get and has a lot of space
for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive
they use about 20 watts or less, Quantum LPS drive use about 10 watts each,
make sure your power supply has more than the drives need. Again if you
use IBM case, the 150 watts power supply for that type case can drive at
least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL),
it's 50pins IDC female connector on each end with 50 conductors
cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be
available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again.
And check the jumper setting on the drive (consult the drive's manual). If you
are using more than one drive with the system, make sure only the last drive
has the terminator (either a DIP or a signle inline package of resistor, which
usually is socketed and close to the SCSI connector on the drive circle board.
Remove the terminator from other drives. [only the last drive should have the
terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5
from ftp sites.

:FLOPPY: ??.??.??
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe
and TT machines. If you own an older Atari ST, there is a company which offers
a $199 kit (including floppy) to install and use the drive. (I will supply
the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the
desktop.

:GRAPHIC: ??.??.??
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by Ben Gilbert
and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync

monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Here's a few more cards, available from OverScan GbR, Saentisstrasse 166,
1000 Berlin 48, West Germany, ++49 30 721 94 66, ++49 30 721 56 92 (FAX),
++49 30 727 05 6 (Mailbox, language: German)

Autoswitch OverScan for the ST (NO STE compatibility) is DM 129.--, you
don't have to buy a new monitor. The maximum resolution on a SM 124
is variable, but in most cases at about 732*480.
AutoSwitch OverScan TT is a VME board. It's about 249.-- DM, you also can use
your old monitor, but it only works in the TTs five color modes
(3 ST-compatible modes, 2 TT-modes). Resolutions are variable, ask
OverScan about the values for your monitor.
Falcon ScreenBlaster blows up your Falcons resolution to a maximum of nearly
900*600 on SVGA-monitors. It'll be shipping as soon as Falcon030s
become available, and the pricing will be near 150.-- DM.

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY: ??.??.??
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM: ??.??.??
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

You will probably need a serial port patch program to use high speed modems on your ST; most versions of TOS have a bug in CTS/RTS handling.

:MONITOR: ??.??.??
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM: ??.??.??
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE: ??.??.??
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases.

The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM

binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE: ??.??.??
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments, suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for compiling most of this FAQ.

Later,

Yes, one very obvious question concerning Connect... How do you get the
dial-dialog to work properly. If you select a number from the list and
click the telephone-icon, the program will tell you that you're already
connected to a host... Makes the program a bit worthless IMO.

1861. I need help with rsrc_load from Basic

Newsgroup: comp.sys.atari.st
Date: 1993-01-31 04:13:20 UTC
From: ph9991_imm@rivers.acc.uwrf.edu
Message-ID: <1993Jan30.221320.692@rivers>
Source record: 211001

Help!

I've been trying to design a program which uses .RSC files, and
I can't get rsrc_load to work. I'm using a compiled BASIC same in dialect
to ST-BASIC on the language disk. I pass the pointer to the filename, call
the AES function rsrc_load, and my STe keeps asking me to put disk A: in the
drive. I'm running my program from my ram-disk G:, and I've tried including
full path names and the .RSC extension into the filename. Nothing works.
What should I do?

Source record: 211002

Questions about Captive...

The robots that fly at ceiling level (so they can't be hit with low-level weapons) can best be fought by using the Anti-Gravity DevScape to flip your party upside down onto the ceiling... then they'll be at the right level to target the robots.. (just be sure there aren't any other enemies in the area on the ground, because you won't be able to hit them from the ceiling..!)

I never tried it, but the Cannon class weapons seem to shoot higher.. maybe they could be used against flying robots too..

I never found a use for the Power Sapper DevScape.. it could be just that, a "red herring"...

Source record: 211003

Gosh Warwick.. I'm sure there must be some remedial reading courses offered at the University of Queensland.. why don't you take advantage of some of them, and learn how to read..?

I'd restate those messages you quoted out of context with smaller, easier to understand words, but I know it would be just wasted effort... you'd quote them out of context too.

Maybe if you find someone to help you with all the big words, you'd be able to understand a little of it. Be sure you have them read you ALL the words, not just a selected few.. it's a lot less confusing for you that way.

(See how it works, folks..? Here we are again, with Warwick just wasting bandwith because he has nothing to say, and no logical answers to the discussion, so he resorts to personal attacks, contrived distortions, and outright lies. Now of course, some of you will flame me for answering him. That will result in even more wasted bandwidth. If Warwick had any thoughts about the issue, or clear arguments to support his position, we might find ourselves involved in a discussion. Now it turns into a flamewar. Please note the sequence of events before wasting even more time and net resources flaming me about this BS.. if you want to argue with me about the ideas I presented, then fine...)

STuffff about TEMPEST for Atari...

There WAS a "Tempest clone" published in ANTIC magazine for the 8bit Atari that was quite good... unfortunately I don't remember the name of it, but I have a feeling that it was written by Tom Hudson... (I just boxed up all my ANTICs to put in the attic, so I can't check very easily).

It used either the Atari Paddle controllers or the joystick.. the paddles were far better, but as mentioned previously, only allowed about 340 degrees of movement. The game was written to take that into consideration though, so it wasn't bad.

There was also a "Tempest-like" game on the Vectrex game console called "Web-Wars"... other than that, I haven't seen any other Tempest clones...

Unfortunately, both the Atari Paddle controllers and the Atari Driving controllers won't work on the ST. The 8bit Atari computer had *8* Analog to Digital converters built in, and the ST has none. The ST has no built in way to read a variable resistance like the paddle controllers. The STe, with its analog joystick ports, *might* be able to read them, though I've never heard of anyone trying it.

(I also can't remember the last time I saw a set of Paddles for sale, much less the Driving controllers... even the stock Atari joystick is getting hard to find.)

I'd love to see a Tempest game for the ST... and I think I'd prefer the joystick over the mouse..

I recently openned my 1040STf to clean my floppy disk drive. I noticed an
empty area close to the monitor connector where a modulator might be mounted
for an STfm model. So, I wonder if one can buy modulators to retrofit the
STf with? Has anyone done this before?

1867. Converting vector graphic formats

Newsgroup: comp.sys.atari.st
Date: 1993-01-31 10:11:00 UTC
From: arosborn@oregon.uoregon.edu
Message-ID: <31JAN199302111398@oregon.uoregon.edu>
Source record: 211007

I have a problem. I need to use graphics created using Aldus Illustrator (line drawings -- mostly maps). I am currently using Arabesque Professional. Please understand: I need vector ("draw") images, not bitmap ("paint"). My version of Arabesque (2.14) can only load GEM/3, Calamus CVG and Arabesque's own AOB files. Aldus is apparently capable of saving images in a wide variety of formats (AI, CGM, DRW, FH3, FT3, GRF, etc.), but not the ones I need. I've enquired locally, and while there are lots of bitmap (NEO, PI?, etc.), nobody seems to know of any vector conversion programs. I'd appreciate any suggestions. Thanks!

> connected to a host... Makes the program a bit worthless IMO.

I've talked about this problem recently.
Your modem always reports a carrier signal to the computer (due to a mistake in the modem config, old (very old) modem or bad cable for connection modem and ST). This is why CoNnect assumes a CoNnection and refuses to dial. You ca fix this problem anyway. Just enter the first modem dialogue (the button with the two arrows and the digit '1' in the dialing dialogue) and disable CoNnects ability to use the 'DCD-signal'. Leave this dialogue with 'OK' and save the SETUP!! Now you can use the dialer without thhis message...

>station's reproduction really supposed to be that much better?

Most .au files are packed 8bit files. They are packed from 12 bit to 8bit
with a logarithmic lookup-table. This format is called "MU-LAW". To play
these files on an ST/TT/Falcon in the correct way they must be unpacked
using the inverse table from 8 to 8bit or 16bit.

The new version 1.0 of our program FORTUNE for the falcon will be able to
convert .au - files to many other formats. Fortune 1.0 will be available
at the end of february at atari.archive.umich.edu.

I have an older Atari 520 ST, and a problem seems to have popped up. The system boots fine (from ROM), but as soon as I try to read a disk, lots of bombs appear on screen. I don't believe the drive is at fault, since it was tried on another machine and works fine. Has anyone else had this problem?? If so, I would appreciate any help in finding a solution.

Thanks,
Scott Macleod

Source record: 211030

SORRY!!!

I just found out I was using the wrong pointer to my file-name.

Whatta dumb mistake...

But I have another question to anyone familiar with AES objects...
What exactly does the RADIO_BUTTON attribute do? It seems to keep me
from selecting two radio buttons at the same time, but what if I
have more than one set of exclusive buttons? (like on the desktop Preferences..
item) how do I define those objects?

Any help will be gratefully appreciated.

Thanks!

Larry I.

>built-in; 16-bit digital audio recording (1 stereo or 2 mono
>channels)/16-bit digital audio playback (2 stereo or 4 mono channels)
>with MIDI interface. Oh, and bundled software.

<Laughs> That's just a sound board. The "DSP" could be a CODEC for
all we know. Can you program that DSP to do JPEG? Didn't think so.
So, for $425 you can buy 1/2 the Falcon's sound HW.

>> I understand you. If the Falcon didn't have the DSP, I wouldn't by it.
>> It would be underpowered and overpriced.

>I think it still is. Then again, you've probably got more of a use for
>the DSP than I do.

I think this is what all the arguments here boil down to. People buy
computers based on needs rather than religion, and that's a GOOD THING.

1892. Re: If .AU file is 12 bit, what happened to 4 extra bits?

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 04:26:08 UTC
From: warwick@cs.uq.oz.au
Message-ID: <11892@uqcspe.cs.uq.oz.au>
Source record: 211032

C556212@mizzou1.missouri.edu (Jeoff Hines) writes:

> While trying to convert an .AU file to something my Replay 4 cart. could
>handle, I asked for help converting the file here on the net. One of the
>replies (sorry I lost your name) told me that the .AU file is a 12 bit
>Sparc station file. If such is true, then when I ran the DIGISTUFF convertor
>file that turned it into an 8-bit unsigned .SND file, why wasn't the file
>size cut down by 30%? (In fact, it was the same size!)

This is because the "12bit resolution" of .AU files (u-law encoded)
means they range in linear value from "0" to "4095". However, they
cannot represent all the values in between... they use a logarithmic
scale though - I believe they give higher resolution at the lower
signal levels. The actual values in a .au file are 8bits. Each of
those values can be translated to a 12bit value via a look-up
table. On >=12 bit hardware, that value can be sent directly to
the sound output, but for 8bit sound hardware (eg. STe) the balues
must be scaled down.

So for example:

ULAW(.AU) 12-bit 8-bit
0 -32256 -126
8 -24031 -94
16 -16062 -63
32 -7964 -32
64 -1891 -8
128 32256 126
192 1891 7
255 0 0

The u-law range 0..64 covers the 8-bit range -127..0. (u-law is low-resolution)
The u-law range 192..255 covers the 8-bit range 0..7. (u-law is hi-resolution)

>funny math going on, where might I find a 12 bit sound player to take
>advantage of the extra sampling? Or was that somehow done by the convertor?
>The converted sound quality is on par with what I expected from an 8000 HZ
>sample comprised of only 1.2 Meg, but lasting 6 minutes. Is a Sparc
>station's reproduction really supposed to be that much better?

Yes. U-law does give better sound. But honestly, 16-bit is FAR superior.
U-law was a telephone standard designed to take advantage of the fact that
human hearing is logarithmic.

On an ST (or STe), it should be possible to play U-law files directly,
rather than first converting them to 8-bit (losing data). All you'd need
would be a different mapping from 8-bit value to PSG inputs.

A friend of mine has some questions that need answering..Please reply in email if possible to me: rasas@minyos.xx.rmit.oz.au or just use the 'r' key..:)

Tanscript follows:
--------------------------start--

Has anyone had success running Cubase and Genedit (Hybrid Arts) under MROS? I have been able to launch both programs but once in Genedit I cannot switch out of it. I am using Steinberg's MROS Switcher program.

Can anyone tell me how to go about getting the V3.0 update for Genedit as I'm sick of ringing California from Oz. and getting an answering machine.

Glenn.

------------------------end---

Also, he has written organising configurations in Genedit for the JV-80 and the JD-800. If anyone would like these just mail me and I'll send 'em to you. Also if someone could point me to an ftp site that would be appropriate I'll upload them.

Cheers,

Greg.

>verify this?
>

Always willing to make myself look a fool and show off my ignorance, I'll step forward. (This is all secondhand from ibm.pc.hardware). The stats they give for the bandwidth of local bus is high enough to take more than one device. Several people have stepped forward and said that the problem with IDE drives is bunk..as they have them running off Local BUS (with their graphics card) and the speed are *much* higher. Evidently some IDE drives support 1-3 speed levels, the highest being compatible with LocalBus.

From artilces I have read, the arbitration on most Local Bus implementations could handle 5 or more devices but the arbitration is so ineffcient that it breaks down after 2-3 devices have been hung off the bus. Some versions of Local Bus (they are not all the same) can only handle one device. I have no idea how you find out which is which (but would take the time to find out if I was going to lay down the $$).

OF course the graphics speed of LocalBus is under some contention. Some reviews say it's no faster than the high end Window accelerator boards, others say that it beats all comers. Vastly typical of the DOS world. I have yet to find a copy of NT so I can find out which of the two beasts it really is a) the OS that will kill all others b) a bloated hack which will eat all system resources while making the user suffer through a slow version of Windows 3.1. (I wonder if it's true about the mouse pointer and multi-threaded apps?)

Anybody out there who has *really* used roughly equivalent Local and non-Local Bus PCs who could give us some information on the actual performance gains?

>Scott

This is apparently a bug in the game. Mine gave me the "Software Pirate,
scum of the earth" tombstone twice (I bought it, and was using the original
disk). Epyx replaced it the first time. I gave up after the second. It was
a great game, although eclipsed by the Dungeon Masters, IMHO.

A standard PC modem cable. DB-25 male on one end, DB-25 female on the other,
wired straight through.

> 2. Is there shareware that can enable him to emulate a VT100
> and use Kermit protocol?

Uniterm 2.0e, perhaps the best modem program for your uses. It is free, and
available from atari.archive.umich.edu (via anonymous ftp). There is a
slightly upgraded version available from another site, but I cannot remember
the machine name.

> 3. Where to find good shareware.

The above mentioned ftp site is the best there is. Also, all the contents
therein are mirrored at wuarchive.wustl.edu, in the
/mirrors/archive.umich.edu/atari directory. Wuarchive is sometimes easier to
get to, as umich seems to always have the max number of ftp users.

> He has a double-sided 3.5 inch disk drive, which I assume is 720K.

> get it to him somehow).

You can read/write PC disks on the machine. If you have an older version of
TOS, you must use a special program to format the disks on the ST to work on
the PC. I personally use ps2form.tos, also available from atari.archive.
On the pc, format the disks with the command:

format a: /t:80 /n:9

(of course, it could be "b:"). This will format a 720k DSDD for both the
PC and ST.

As far as I've heard that's vaporware. There is however a chip socket on
the Falcoln motherboard that looks to take a 386/486 chip. Atari has not
denied the possibility and that's about the extent of my factual
knowledge of that.

Hmm, I would have sworn that the newer 88mb drives could only read the older
disks. I will have to check on this with the folks at TOAD (1-800-448-TOAD).

Two things come to mind. One, he may have a write cache enabled (what kind of host adaptor does he have?), and he is not giving it time to flush before turning the machine off. Two, he may be experiencing the 40-Folder bug, which can be fixed by using foldrxxx.prg (available from atari.archive). If he has an ICD host adaptor, the software will fix this bug itself (but you still have to specify to get it to do it). Also, he might try getting some disk diagnostic programs. I seem to remember that there is a demo version of CleanupST on atari.archive. The best software of this type that I have seen is Diamond Edge. Very nice stuff!

I have had this problem too.

I have found that this can be fixed by turning the modem off and then
on again (I suppose atz should probably work too, but I didn't try it). I
believe this means that the modem is not clearing one of its sense lines
(I forget just now) so that a power on/off should clear it.

1908. Re: A1200/4000 v. Falcon 030 FAQ

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 09:31:48 UTC
From: David.Dell@bbs.actrix.gen.nz
Message-ID: <1993Feb1.093148.21593@actrix.gen.nz>
Source record: 211048
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.hardware,comp.sys.amiga.advocacy,rec.games.video

From all the observations my friends and I have made of the new Amigas and the Falcon 030 (latest revision 4 or greater), it is quite odd to find that the Falcons run -much- faster when higher resolutions and colours are involved. What I'd like to see is some experts explain clearly why a 16 mhz 68030 equipped Falcon can throw 256/65536 colour pixels around better than a 25 mhz 68040 A4000.

I think the new Jeff Minter game for the Falcon illustrates the disparity in graphical power by displaying more than 10 layers of parallax scrolling with 256 colours fore and backgrounds in full arcade speed and accompanied by digitized stereo sound samples. Many people have conjectured that even the A4000 could not produce similar 256 coloured action because of the bitplane graphics format of the Amiga architecture. Even the dedicated consoles like the SNES and Genesis would be hardpressed to reproduce Minter's game at similar speed.

The 32 mhz 56001 DSP in the Falcon 030 is a hidden weapon too, because it can decompress JPEGs in graphical adventures in a split second and can be programmed for the first games that ever used voice recognition in a low cost computer. Commodore is attempting to put the AT&T DSP 3210 in the upgraded version of the A4000, but some hardware experts have told me that if the A4000 with a 68040 is graphically slower at high resolutions compared to a Falcon 030, the DSP would be an elegant waste of technology because of the logjam in the present Amiga chipbus/video architecture.

1909. THE PC FALCON DEBATE.

Newsgroup: comp.sys.atari.st

Source record: 211049

This is NOT a flame! It's just an extract from a letter in a magazine talking about micros. So I don't wan't people mouthing off about how good their new 586 is.(That is NOT a home micro!) I did not write it. I am mearly passing it on to everyone who's been putting the Falcon down. And I repeat what I said in an earlier piece, "Every computer has it's place, it's good points and it's bad points. A PC is great in the business world with a huge following technically but is a bit pricey from home use. A Falcon is a great home micro which has many uses but will never make an impression in the business market. An Amiga is also a great home computer with good graphics and a large games base but hasn't a hope of making it in the business world. That's the facts. And whomever disagrees is living in a world tinted by their own computers brand names."

"I noticed an advert in your magazine for one of your numerous sister magazines. The interesting part of the advert was not the main content, but the small print at the bottom claiming that a 25MHz clocked 80386SX based PC is faster than the new Falcon.
<text skipped>
Obviously a 25MHz processor, to the uninitiated, will appear faster than a 16MHz processor, but in the quoted case, this is blatantly untrue. The 68030 is a full 32-bit processor with an onboard instruction cache. The 80386SX is a 32-bit processor internally, but with only a 16-bit data bus externally. Thus it takes the 386SX two instruction cycles to access 32 bits of memory, where the 68030 takes just one. Add to this the fact that most 32-bit fetches are for the instructions themselves and it becomes clear that clock speed does not equal processor speed. Far from it, since most CISC processors such as the two above take, on average, several clock cycles to execute a particular instruction and this average cycles-per-instruction ratio varies widely between different processors.
Having said that, there is the general claim that the PC listed is faster than the Falcon. The Falcon will be a state-of-the-art machine and you need a very fast PC to equal its processing power. Processor speed is measured in MIPS (for measuring the execution speed) and in Whetstones (for measuring the mathematics speed) and not in MHz as used by the people at PC <name witheld> and several other PC magazines, though measurement by MHz is useful for comparing different PC compatibles.
To build a PC equal to the Falcon you would need at least a 80386DX based PC, clocked at 33MHz - the high clock speed being needed to compensate for the speed loss because of DOS and the BIOS. You would also need a fast VGA video card (since the cards fitted as standard by most suppliers are inadequate for playing graphically intensive

games), say one of the ORCHID range, a multi-channel sound card and as much memory as you can afford. The cost of such a setup would be in the region of 1,500, for which you could have a Falcon plus lots of extras.
But I was forgetting, the Falcon also contains a DSP 56001. This chip is not just for handling sound and pictures, but is also a lightning fast processor which easily outperforms even a 32MHz 80486 because it can perform operations in parallel and with phenomenal efficiency. So maybe those PC owners who want the sheer processing power of a Falcon had better wait for the 80586 50MHz to come out......"
<name> Electrical Engineer.

The letter does not end there..but this is the part I wanted to let you all read.. Can anyone disprove what is said in this letter? If so, write the fact and then underneath the disproof. I repeat I'm not flaming. I just want the facts, whatever side of the line they lie on, as I use a PC at work and will be using a Falcon at home (soon).

Cheers all.
Craig <craig.dunn@almac.co.uk>

Either get a weapon that fires into the air (a rifle, for example, from memory)
or get an anti-grav thigy (long time since I played, can't remember what they
were called).

I liked Captive at first, but it got too samey. I think I got to the 5th
space station (ie 5 times through ten planets) and then got bored. His
more recent fantasy game (name escapes me) was a lot better.

There is a program called EXTEND.PRG, should be in the Disk Utilities section of atari.archive. Not sure about this 'copy protection' though...

Yes they did! I have the ad for it in front of me now on the back of the May 1985 issue of Acorn User (why do I keep these old mags?). There is a circle with "Atari approved" written in it. However I think Atari slapped Superior around for their version of Joust so much that it was withdrawn from the market.

I too would like to see an ST version of Tempest too and would be very suprised if Andromeda didn't make one since they did so many arcade conversions to the ST that worked in mono too!

Still on the old game subject. Was there ever ST conversions made of Frogger or Donkey Kong?

Source record: 210956

When this 486 board arrives (assuming the Falcon arrives), do you think will accept PC-clone add-on cards?

It would presumable need a seperate box for this. Even if it doesn't, is it technically feasible within the Falcon archicture and would we see perhaps a rival product with this facility.

I reckon it would be dead useful...

>have more than one set of exclusive buttons? (like on the desktop Preferences..
>item) how do I define those objects?

Of any set of radio butons that have the same parent, only one at a time will
be selectable. So, if you put e.g. 2 rbuttons in a box, and 3 other buttons
in another box and then put those 2 boxes in a dialog, you'll have a dialog
with 2 sets of rbuttons. Very simple, in fact.

O, and don't forget to pre-select one of the rbutons of each group (either in
the RSC itself or, better, by setting the appropriate flags in the program
after you've done a rsrc_load & rsrc_gaddr's), since it's very ugly if a
dialog, when opening for the first time, has all it's radio buttons
_de_selected...

1922. UNIX GIF to SPC converter wanted

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 11:44:48 UTC
From: dac@ukc.ac.uk
Message-ID: <1092@rook.ukc.ac.uk>
Source record: 210962

Does anyone know of a _UNIX_ utility to convert GIF files to SPC files? Even better would be a PPM to SPC converter (thus allowing all the formats known by the pbmplus utilities to be available).

If there's no such utility, the C source for an existing ST converter would be excellent.

Cheers,
Dave.

There's a program around called expander which runs as a .PRG or ACC (I think; it's a while since I've used it) and works fine. It's french, but it's pretty obvious what to do, only about four incons on the whole thing. Regarding copy protected discs, give up now unless you fancy removing the protection by hand first; most games need to run off the bootsector, and you'd need to be pretty competent as a hacker to do it.

It doesn't sound like the keyboard processor is broken -- if it were, it would be more likely that the whole keyboard and mouse stopped working altogether.

I assume you've checked things like the connection between the mouse socket and the PCB (the socket tends to lift away if it gets a lot of aggro), and the continuity of the PCB track from the socket to the other components on the keyboard PCB?

This is not exactly an answer. But it is relevant(ish).

I have just created a map for a guidebook, first scanning an old map, then touching up (TouchUp), then vectorising (Avant Vektor - perhaps the best Atari program of all?), then polishing in Didot Lineart (also wonderful).

I then saved to .CVG, and tried to put into Calamus 1.09 (my SL still hasn't arrived, after 2 months. Grrr).

The .CVG imported fine, and behaved perfectly on screen; but when I print ..... The machine locks. I suspect that this means that one of my paths has too many points (or that the graphic as a whole has too many) - I read about that somewhere. I am hoping that the problem will simply go away when Calamus SL finally arrives, but we shall see...

Anyhow, the message is - check more than just the file formats before investing a lot of time - I put about 20 hours into that map 8-(.

Mike Morris.

The total palette is an 18-bit one, meaning 262,144 colors are possible
in the color-mapped modes. In the true-color modes, I believe you
always just get the same 16-bit (or 15-bit with titling) palette. So
6 bits of (r,g,b) in 256-color mode, and 5 red, 6 green, and 5 blue bits
in true color mode (or just 5 bits for (r,g,b) with titling).

1929. Re: PC DITTO & Falcon first impressions by a new user...

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 14:09:22 UTC
From: Craig.Graham@newcastle.ac.uk
Message-ID: <C1rwnn.EtG@newcastle.ac.uk>
Source record: 210969

Got a Falcon on Saturday, here's what it's like:

(1) I tried running PC-Ditto on my Falcon a few days ago....no go I'm affraid, this is just another of the (extremely large, inspite of what atari might have us believe) list of programs which don't work. Other programs which break include almost ALL games I've tried (out of approx. 50 games, three (older ones) worked. Even Llamatron (which runs on a TT as well as ST/STE) crashes rather badly.

(2) But, that said, I didn't buy it to play old ST games on anyway, the ones I've managed to get going run to fast to be playable anyway.....

(3) The new desktop is a joy to use.

(4) The system is very much faster than an ST. Quick Index reports processing improvements of 450% -> 550% over a standard ST.

(5) There is VERY little in the way of software shipping with the Falcon.
- The games that come with it would have embaressed my old Dragon 32.
& Landmines actually has bugs in it which prevent the sound working properly.
- The System Audio Manager promised has NOT appeared.
- Although the (inadequate) manual tell you how to use it, MultiTOS is NOT there.
- The calculator is a waste of space (it's a PROGRAM, not an accessory).

(6) Although the True Color demos are very pretty, Atari has refused to let their dealer's give them away with the falcon, so there is NO software with generally available to make the machine look anything like the impressive beast it really is....

(7) All my serious software run's fine though (Calamus, WriteOn, HiSoft Basic2 (although it has a slight problem with the new AES dialog check boxes), GNU C, etc) with more speed & less crashes....

First impressions....nice, but not that nice, after all the delay's there should have been a MUCH more professional and impressive package put together than this.

Nice computer, shame about the software.

Mail me if you dare to argue with this first hand experience. It won't change the facts though.....

The reason I asked was because i _don't_ need a 486 card. I _don't_ need
windows. I _don't_ need WC 2. I f I wanted those, I would just buy a real
486 instead of the Falcon.

I thought that is what the 'm' stands for in STfm. Doesn't the 'f' mean
that it has an internal floppy drive, as early ST's had external drives?

>Okay, who's going to do the Atari-specific graphical version!!! I wanna play!

This weekend I ftp'ed the sources and a friend with a 20MB (RAM, not
HD) TT compiled it (took about 2 hrs - longer than building the gcc ;-)
He's going to make an ST version as well. I could certainly post
all of this stuff to comp.binaries.atari.st RSN, but should I? Maybe Eric
Smith is planning to do the same, so I really don't know what to do...

I'd like to hear your opinion. Send me E-Mail (or post if you can't)
if you really need to see all this stuff posted. In any case I will
make the ST/TT versions available for ftp at 134.102.228.9
(wowbagger@pc-labor.uni-Bremen.de) in a few days (could be a week).
The files will be in pub/atari_st/games (surprise).

BTW, the new nethack 3.1 won't fit into 1 MB of memory anymore! That
is, with all of the new options compiled in. Fanatics with only one
meg should consider upgrading their machines - you wouldn't want to
miss some of the new features, would you?

At last, a big *thank you* to the nethack team and especially Eric
Smith who did the atari port (I really don't care if that delayed the
development of MultiTOS :-)

Nethack 3.1 is stupendous!

Christoph

1935. Local Atari User Group Meeting - Wed Feb 10/93

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 15:30:22 UTC
From: daroloso@math.uwaterloo.ca
Message-ID: <C1s0EM.C4C@math.uwaterloo.ca>
Source record: 210975
Cross-posted to: ont.micro,kw.micro,comp.sys.atari.st,comp.sys.atari.8bit,uw.sys.atari

In February, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
Printing Tricks.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the January issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, February 10, 1993
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

1937. Atari floppy drive to Macintosh?

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 16:07:27 UTC
From: keesh@wsinti01.info.win.tue.nl
Message-ID: <5127@svin09.info.win.tue.nl>
Source record: 210977
Cross-posted to: comp.sys.mac.hardware,comp.sys.atari.st

I can get an external floppy drive for the Atari ST and wonder whether I could connect it to my Mac SE. Of course, I need a special cable, but then, do I need a driver and do these exist, or is their a chance that the MS-DOS capabiltiy of the Super drive driver gets this thing to work? (Atari ST uses basically DOS format, at least I could read the disks with AFE).

Thank you for your attention,
Kees

Yep, it's true, as long as you restrict yourself to Mac Plus emulation (b&w only, no color). Buy a Spectre GCR (from Gadgets by Small) and a set of 128K Mac ROMs for around $500 retail (or about 1/2 that used), plug it into the cartridge port of your ST/STe/TT and you may then run Mac s/w faster than a Mac Plus on a larger screen (using Atari's mono monitor). There are caveats, of course, but in general, it's a very slick device that works very well indeed. A used "real" Mac Plus can be had for under $500 now, of course, but there are tradeoffs both ways. Oh, and System 7 is not supported (yet) by the GCR.

>
> What is the total palette of the Falcon?
>

The Falcon has a total of 256,144 colors with 65,000+ on a 640x480 screen in its maximum resolution. The 256 color mode is available in 320x200, 320x400, 320x480, 320x240, 640x200, 640x400, and 640x480. All of these graphic modes are based around an 8 bit plane. The Amiga 1200 only has a 3 bit plane per color. This makes the graphic handling much harder to manipulate on the Amiga. Rgardless of the custom ships, it can't handle all the fast color changes the Falcon can...

1940. Printer Driver

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 16:33:11 UTC
From: dan@mksinfo.uucp
Message-ID: <1993Feb1.163311.15210@mksinfo.uucp>
Source record: 210980

I could not find any other group to post this so here it is:

I enhancing an application that was developped on an IBM PC
using Gem VDI. Right now I'm trying to print on color printers
but I cannot set the user defined pattern to a polychome one.
The code wich work fine on the screen, just use use the pattern
for the printer as if it was a monochrome pattern.

I've tried it with different color printers which all used
their own Gem Driver. And all the printer driver do the same
thing. Am I missing something ?

here is an example:

```
vsf_interior(handle, 4);
vsf_udpat(handle, pattern, 4); // set a 4 plane pattern
vsf_fillarea(handle, 4, box); // simple box
```

if my handle refer to the screen, the pattern will be used to fill
the polygon, if my handle refer to the printer, the first bit plane
will be used, and all the one will be expanded to the current
fill color (last vsf_color). So if anyone has some suggestion
it will be greatly appreciate.

Daniel Anderson

>So maybe only some 1040STf's really have the RF modulator.

Here's the rundown of atari naming conventions :

ST : Sixteen / Thirty Two (Sam Tramiel)
TT : Thirty two / Thirty two

STF : st with (F)loppy drive internal.
STM : st with (M)odulator for TV but no internal Floppy

STFM : st with both of the above

STE : st (E)nhanced

So the 1040STf was never meant to have an RF modulator at all.....

Since there appears to be a Dungeon Master thread in full flow,
I'll post a few queries which I never really had answered before.
Firstly, what exactly does the "Put the gem back" puzzle do? I
don't think I ever tried taking it, as gems always seemed pretty
useless (or aren't they?) so I'd quite like to know. Regarding
the idea of finishing the game using only magic, it'd be quite
tricky. Has anyone tried it? Personally, I like trying to get
through as fast as possible using only one character; I've got
it down to about four and a half hours, although I skipped past
quite a lot on that. Anyone beaten that? (I do hope so, it'll
give me a new challenge :)

>the name of it, but I have a feeling that it was written by
>Tom Hudson...

Actually, it was in ANALOG and it was called LIVEWIRE! I don't
remember who it was by, but Tom Hudson sounds right to me too.
(Remember the days when there are enough Atari magazines on normal US
bookstand shelves to get confused like this... :-))

>It used either the Atari Paddle controllers or the joystick..
>the paddles were far better, but as mentioned previously, only
>allowed about 340 degrees of movement. The game was written to
>take that into consideration though, so it wasn't bad.

I never had paddles so could never try that out, but the joystick option
actually worked better than I thought it would.

>I'd love to see a Tempest game for the ST... and I think I'd
>prefer the joystick over the mouse..

I liked LIVEWIRE! enough that over the years I kept toying with the
idea of porting LIVEWIRE! to the ST (you know it would be a game that
worked with the monochrome monitor because that's all I have :-)).
However, something else always got in the way (e.g. school). However,
the last I checked (yesterday), my copy of ANALOG with the source was
nowhere to be found. (Remember the days when magazines would publish
source code, even if it was pages and pages of 6502 assembly? :-))
Also, I still don't think of an easy way to do collision detection on
the ST! :-)

In any case, I wonder how legal it is to do a clone of a clone? :-)

Inaccurate in many points. Firstly, the Amiga 1200 is fully capable of handling 8 bitplanes of graphics. It does so in a 24-bit palette space, unlike the Falcon. The blitter is still somewhat slow, but the system has 0% contention in 320x200 mode at a full 8-bit resolution, the main processor has full access to ram. Its copper is fully capable of fast color changes, and you're quite incorrect in many of your assumptions. And yes, 320x400 is possible in non-interlaced modes. I'll not list the thirty or so possible graphics modes for the AGA chipset, however.

The 12-bit palette is gone under AGA, you're using old information for your determinations.

1951. *** For Sale ***

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 18:43:27 UTC
From: rgmvg330@glen-ellyn.iit.edu
Message-ID: <1993Feb1.184327.26768@glen-ellyn.iit.edu>
Source record: 210991

The following items are for sale:

1040STf, Tos 1.0, 1 Meg Ram, excellent condition - $150
SF 314 Double Sided drive with all cables - $40
16 1Meg Drams - $60
Micronta Multi Meter with Range Doubler - $20

I would rather sell in the Chicago area, but I will ship anywhere in
the US if buyer splits the shipping. Also for anyone that buys the
1040 I will throw in some software including Modula 2 and Mark Williams C.

But I don't want to go to ASCII, then I lose all my formatting, and
have to spend another 30 minutes in the lab reformatting my document.

```
REQUEST FOR DISCUSSION
======================

This is a request for discussion on the creation of a newsgroup for
debates about the Atari range of personal computers.

Group Name
==========
comp.sys.atari.advocacy

Status
======
Unmoderated

Rationale
=========
This group will separate a section of discussion from the current
newsgroup comp.sys.atari.st and atari.8bit.

The discussion of advocacy currently takes up over 50% of the items
in the atari.st newsgroup and so it is felt that the original
purpose of the newsgroup is being left behind.

New users and people who need information about the Atari ST can
continue to use the original group and would hopefully get more
attention if there is less advocacy mail present.

What a FAQ for this group could contain is also a matter for
discussion.

Discussion
==========
Comments on this proposed new newsgroup should be posted to the USENET
newsgroup news.groups. If the reader is not able to do so, comments may
be e-mailed to any of the proposers, at the addresses below, and we will
post them.

Voting
======
If no problems arise, voting will start one month from the posting date
of this RFD.

Proposers
=========
David Oakley dxo@cs.bham.ac.uk
Ian M Rae imr@cs.bham.ac.uk
```

1956. NetHack 3.1 binary available!

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 19:51:00 UTC
From: christof@wowbagger.pc-labor.uni-bremen.de
Message-ID: <1993Feb1.195100.10909@informatik.uni-bremen.de>
Source record: 210995

It just so happens... that Nethack 3.1 for the ST is now available on 134.102.228.9 in pub/atari_st/games/nethack31.zoo.

The binary was compiled with all the configurable options included except "show score on bottom line." It will run on a TT as well (in fact, it will probably run on any atari machine with enough memory). As I said in my previous posting, it does *not* fit into 1 meg of memory anymore, to achieve that, some of the features would have had to be discarded, and we certainly didn't want to start off with a reduced version (grin).

A TT-only version (50 KB shorter and *possibly* faster - although it makes no difference when playing) will follow RSN.

Have fun with nethack!

E-Mail me if you have comments, if it doesn't run on the falcon, etc.

Christoph

Golly, I bought a copy of Tempest for my ST. It's commercially available (like most Atari software, available is somewhat a relative term). It doesn't port well, because it uses the joystick instead of a little knobby thing, and the sound effects aren't as nice. All in all, it just doesn't have the right feel.

If you really want more info (the distributer or something), I can get it for you, but prepare for disappointment.

1960. Re: A1200/4000 v. Falcon 030 FAQ

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 21:06:33 UTC
From: David.Dell@bbs.actrix.gen.nz
Message-ID: <1993Feb1.210633.25389@actrix.gen.nz>
Source record: 210999
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.hardware,comp.sys.amiga.advocacy

The fact about the Atari Falcon 030 performing fast decompressions of JPEGed pictures is just that -- a fact that has been demonstrated. The implications are that a single 1.44 MB disk can be filled with 20-40 compressed pictures that can be displayed very quickly implies that graphical adventure games will be a very gratifying experience on the Falcon 030 compared to other platforms where the main processor literally halts the game to perform decompression.

It would be interesting to put the Falcon up against a 25/33 Mhz 486 running similar games too. Since the SCSI-2 DMA port on the Falcon is capable of 3+ MB/s transfers, it probably is faster than 99% of all the sub $4000 PCs in use today. Of course since Commodore only provided an IDE interface that soaks up almost 100% of the '040 CPU in the A4000 and still only manages around 1 MB/s rates, so an application like JPEG decompression will feel slow and awkward relative to the Falcon 030/56001 dual processor scheme.

Because Commodore chose to install a low density 800KB drive in the A1200 means that software will be distributed on 800K disks while every other platform will use 1.44 MB as standard. It is interesting to note that if the Falcons were in a LocalTalk network setup, data would be transferred as quickly between them as would an A4000 user trying to load the data directly from the 'dual-speed' Chinon floppy drive! The LAN chip can be programmed to operate 2-3 times faster, while the A4000 user must wait for promised future chipset before he/she can use a normal 1.44 MB drive found in all other systems.

There was a commercial Tempest out but it was so incredibly badly done that everybody just laughed and threw it in the dustbin. Someone obviously never heard about "quality control" and "game testing" etc. It looked like it was ported straight from the Spectrum and slowed down.

On the Amstrad CPC range of machines there was a decent Tempest though.. I still remember it as being one of my fave games on that machine..

Actually I think it was released by Atari themselves.. Makes you wonder what Steel Talons will look like on the Falcon.. let's hope they've got some new programmers..

Cheers,

1968. Amax II death under 2.1 with 2.05 ROM

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 22:56:31 UTC
From: beachler@iastate.edu
Message-ID: <C1sL29.Lw9@news.iastate.edu>
Source record: 210856
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.hardware,comp.sys.amiga.advocacy

I just installed a new 2.05 (not 2.04) rom in my A500 rev 5.
Everything seemed to be functioning properly under 2.1 with my A590/A500
combination until I tried to run Amax II from my hard drive partition.
Amax has no problem finding the 128K roms but once you try to actually
boot, the screen sets itself to the preferenced colors and then freezes
in a blank state. It never makes it to the happy/sad/question mark mac
screen. The setup part of Amax recognizes my partition name and driver
(scsi.amhd) but doesn't appear to successfully attempt disk access
(no access light blink). Yet I believe the driver is at the root of
my problem. If I make sure the partition is not mounted, Amax functions
fine and will boot from floppy. If I remove scsi.amhd from DEVS, Amax
recognizes my partition name and complains that it can't find the scsi
driver but still boots OK from floppy. I even tried a newer version of
the scsi.amhd driver I obtained from someone with Amax 2.5...same results.
Am I doomed to go back to floppy-only access? I tried reformatting under
2.1, mountlists, automounting...all with the same results.
Anyone have any ideas...590 ROMs, new scsi.amhd driver, anything?

Thanks to all in advance!!!
Rich Beachler

Is it marketed any differently than how it actually is? I've read a TOAD catalog, and another ad (Computer Studio???) and they were both very clear abou the CPU cache.

-Matt

P.S. Lemme know if you find sales-droid slickness elsewhere -- I'm still not clairvoyant. :)

: IF you have added FAST RAM to your A1200 of course.

Did I _MENTION_ fast ram? No. If you're running in 320x200x8, there's
no contention out of chip ram. One doesn't need fast ram to get decent
speed, then. Fast ram will add, perhaps, 20% to the speed, however.

Sure beats Yet Another Crippled System, yet another 16-bit memory arch...

Greg

1973. Atari System for Sale

Newsgroup: comp.sys.atari.st
Date: 1993-02-01 23:37:18 UTC
From: caude@comtch.spk.wa.us
Message-ID: <VsgByB2w165w@comtch.spk.wa.us>
Source record: 210861

I have an Atari ST computer system for sale. I will sell it either in
peices or as one big package. Here is what I have:

Hardware
========
Atari Mega ST4 Computer (w/ TOS 1.4, Mega STe keyboard,
and GoldenImage mouse) $475
Atari SLM804 Laser Printer $475
Spectre GCR w/ ROMs and software $225
SuperCharger w/ 1Mb RAM and software $225
Amplified Stereo Adaptor $30
2 TAC30 Joysticks $25

Software
========
Calamus 1.09 $90
GFA Draft Plus $15
WordPerfect 4.1 $80
Red Storm Rising $25
Ultima IV $25
Planetarium $25
GFA Basic 2.0 and 3.0 w/ ref manual $70
UltraScript $70
BBS Express! ST 1.79 $70
==
Total $1925

Entire Package (-10%) $1730

These prices do not include shipping. If you are interested, I (Chuck)
can be reached at:

509-235-8746 (voice),
Chuck Aude at 1:346/18.0 (FidoNet),
or caude@comtch.spk.wa.us (InterNet).

> verify this?

No way.

The VESA LocalBus standard specifies up to three cards... Video and
nice fast SCSI-II cards will be the most common uses. If using two
cards there ruined the performance, there'd be no point in having the
extra slots...

That's what I needed the manual for.

Damn, why didn't the author distribute it as a complete tree! (like a
GEMSYS directory already there!) I *hate* when people put archives inside
of archives! (CsTex seems to take this to ridiculous lengths by putting
lharc archives inside a zoo archive! Arghhh! Why not zoo (2.1) the whole
damn tree!)

The original 88 meg Syquest could read (but not write) 44 meg carts.
Syquest just released this new one that can read and write on 44 meg
carts. I don't know if Toad has these mechanisms available.

Very simple... takes a while to churn through GCC though!

I'm also writing a CAD-3d -> POV-Ray converter... If all goes well,
you'll be able to use CAD-3D objects in POV-Ray images.

>similar to that of most video game machines, and they cost less than $800 --
>including the ability to play audio Compact Discs!

I have to disagree with you here, At least with the VIS. I spent some
time at Radio shack the other night infront of the VIS demo station. I
was sucked over by a bird locked in a cage wanting to get out, So I
did... I was quite impressed, a real mulitmedia machine. As I continued
to use it, I found it was nothing more than a "Nintendo on steroids"
(sorry, I couldn't resist ;^>). The graphics was jerky and slow. The
graphics probably could have been faster with better anamation, but it
was rather slow. I imagined good old Cyberpaint with the speed control
locked on "turtle" mode (Ok, so I am making a point, I was slower than I
expected, much!). If that didn't bother the people around me, the disk
access sure did. Many people got discouraged, looking at there watched
every time the "artificial" (would it be called) computer loaded the
next segment. (The left, I of course stayed) I also thought the colors
could have been better. The bird seemed to be in a simple 8 or 10 shade
purple (I'm being generous it think, but I don't know the actual number,
I could be full of it). I was expecting a multimedia device to be in
"The Mind's Eye" type colors, but I know that is outrageous...

>Since we all know that there IS no real 'home computer' market out there
>(in other words, people don't buy a computer to balance a checkbook,
>maintain a recipe file or write short letters), there is no real need for
>more than a hand controller with the ability to "point and click".

The VIS did attempt a "point and click" interface with the Nintendo-like
game pad on it. It was a very sorry attempt though.....

>No VGA/multisync monitors are necessary. Your color television screen is
>going to be the 'lowest common denominator' when it comes to new game and
>CD-ROM program design.

On the $500-600 TV/monitor, the graphics were _very_ __VERY__ blurry.
If anyone was going to spend the $800.00 on the unit and $70.00 on each
game, he'd be crazy not to fork over the extra $300. for a monitor.

All in all, the VIS is too young to take over the computer world. It is like saying that the old 8K 1MHZ machines would take over daily operations in our offices (ie, paperless offices). The VIS is a _GOOD_ start, but from from marketable right now. It has a long way to go. And dispite what you believe, It needs a keyboard (or some kind of voice recognition system....) or it can't be expanded like a computer can.

Source record: 210878

Hi! It's the bug Sam Groves again with a few more questions.

1.) I have a 520STfm with 1/2 meg ram, one disk drive requiring forced media change to run semi-correctly, TOS 1.0, and MANY MANY old programs from back when ST-Log and Start were first in business. Now I would really REALLY like to upgrade it to 4meg ram TOS 1.??/2.?? and a high density drive. My problem is : a. I don't know if I can replace my old TOS with a 1.?? and also have 2.??, b. I don't know how many (aprox) of my GAMES would be incompatible, and c. I think this would cost almost as much as getting a new STE (of course I then don't know what will work on this either). ANY suggestions or answers?????

2.) I have also been thinking about harddisks, though currently a hard drive is way out of my price range for something the size I need, I was wondering if those who have hard drives really think that this is VERY important(i.e. are the programs to big for disks any better than those that aren't?)

Thanks for any replies
s112397@umrvma.umr.edu Sam Groves(: As If You Cared :)

> list!
Hmmm, I've obviously broken some sort of trend, how about "the
Falcon runs on spooge, so nyaah to you!" Actually, my own opinion is that
the ST machines and the earlier Amigas were (from an end user's
perspective) very similar, so some of the animosity between the two camps
may have been insecurity over whether people had bought the "better"
machine.

As I mentioned in my last posting, I've seen the Falcon in use,
but there are some aspects of it I don't like. 1: I find the GUI UGLY,
UGLY, UGLY! I have to admit that I didn't try to find out if it could
be customised to make it easier to look at (I spend several hours every
working day using X-windows, sometimes MS-Windows and at least 2 days
a week, a mac of some description, then I go home and use Workbench
2.04 on my Amiga). In the form that I saw it, the Falcon GUI would give
me eyestrain and headaches. 2: The casing. I have an A500, I don't want
another "console" style machine (I don't dislike "console" style machines,
I just don't want 2 of them, since I have reasons why I will hang onto
my A500 even after I get another computer). This is also a reason why I
have no plans to buy an A1200. I also need something with internal slots,
so both the Falcon an A1200 all short in that regard as well (I have a
transputer card for an XT-PC, but I don't want an XT just to run the card.
There are 3 Amigas which have XT-slots in addition to the Zorro slots
which are the standard expansion slots for Amigas). Another point is that
if I change to a Falcon, unless I could get an Amiga emulator, none of my
software would run on it.

> My house-mate bought a 1200 a couple of weeks ago and we've had some interesting
> results. It seems to depend A LOT on programming techniques. He's currently
> writing his own version of BASIC (very GFA-like and pretty impressive!) and his
> routines seem to perform much quicker than on his 500.

The EC020 has a small instruction cache, so this may be where some of
the speed is coming from.

[other comments about Basic deleted]

C= dropped Basic quite a while ago. When version 2 of the Amiga
O/S was released to the public, Basic wasn't included like it had been with

earlier versions. You can only get Basic from an earlier version of the
Amiga O/S or buy it as a seperate language, like any programming language.
Personally, I think *all* personal computers should come with a programming
language as part of the O/S, but which language? DevPac? ;-)

Hi,

In the 10/92 issue of ST-Magazine (a French Atari-magazine), at the end of a
flame from Dave Small titled "War inside the computer", discussing about
MAC and Pascal you can read the following:

```
IF {LANGUAGE(loved) == PASCAL} &AND& {EMOTION == INDIGNATION} DO
Adress CompuServe = 00000,000;
Adress GEnie = Nil;
Adress Internet = ping.pong;
ELSE
Adress CompuServe = 76606,666;
Adress GEnie = DAVESMALL;
Adress Internet = dsmall@well.sf.ca.us
ENDIF
```

1994. Know any good FTP sites?!?

Newsgroup: comp.sys.atari.st
Date: 1993-02-02 09:28:07 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Feb2.092807.3271@dct.ac.uk>
Source record: 210883

Howdy! (again!)

Having recently myself discovered the wonderful world of ST FTP lists, I
was wondering if anyone could name any sites that are worth looking at.
I at present have only one, ATARI.ARCHIVE.UMICH.EDU, which is a good one.
As far as what I'm looking for from these sites, I particularly like demos
but am more inclined towards Sound/NoiseTracker .MODs. I've gone through
all the ones in ATARI.ARCHIVE, and some of those were brilliant.
However, is it just me or what in that I seem to have an amazing amount of
difficulty with .MSA files, in that it seems that only one out of ten that
I pull off work? Problems that I encounter vary from getting a load of
garbage on the disk, to absoloutly nothing on the disk!! This is incredibly
frustrating, especially as the demos I see (like OVERDOSE, PHALEON, etc) I
have been after for ages, only to discover that they don't work!!

Anyway, sorry for getting distracted there. Any help with sites would be
greatly appreciated!!

Thanks!

PS> This might be sacrilgeous, but I know that we can run Amiga .MODs too,
so if anyone knows any good sites for those as well.....
(Maybe I should dare to tread in the Amiga news..... mebbe not....)

1995. MSA.PRG Source ?

More tale's from the lone Falcon owner who isn't a developer (I feel lonely)....

The direct to hard disc recording software that I DIDN'T get with
the machine was posted to atari.archive.umich over the weekend &
is nothing short of amazing....it's PD, but it produces BETTER than
CD sound without ANY add-ons at all !!! Samples @ 16 bit's
50KHz stereo, and still lets you use accessories & stuff while it
does it, & sticks it all on the hard disc so you get big samples.

Fills the disc up a real bugger though.....

Hi there!

A friend of mine needs to have the HDX5.01 harddisk formatting tools, because he is having some troubles with an optical drive with HDX5.00 and he was told that 5.01 would fix them. He told me that it is in an Atari Mailbox in Germany, but we both don't have modems, so I wondered if it isn't possible to copy it via ftp, but no archie server was able to help me...

>color. This makes the graphic handling much harder to manipulate on the Amiga.
>Rgardless of the custom ships, it can't handle all the fast color changes the
>Falcon can...

But you forgot to mention that the 640x480 and 640x400 True-Colour modes
are interlaced. Secondly the 3 bit plane per colour is only the
limtation of older ie ECS Amiga, not AGA machines such as the A1200 and
A4000. Thirdly, didn't I argue this out with you on r.g.video a few
months ago. You were making the same (false) claims then...

What these are some good points/advantages, it doesn't make up for everything.
For example, PC games are starting to come out in 640x480 format, and
while the Falcon has that display capability, it is interlaced.
And also, the Amiga 1200/4000 outperforms the Falcon in practically any
incarnation of what an arcade game should be.

>
That's really assuming a lot of things that are definitely not
in evidence.. First of all, you are assuming an A4000, and
you are assuming that the IDE soaks a lot of CPU time.. Have you
tried putting a performance monitor program on this and bearing
out these assumptions..

Also, just think how fast a 4MB PCMCIA ROM card on even the 020
based A1200 is going to perform.. Gee, that could be instantaneous..

I think you also have to be fair about this and put an A4091/2
SCSI-II controller on the A4000 and then let's see.. I would
be willing to bet a Zorro III card might just prove your
assumptions wrong... Also, don't give me this "but it's not
built-in stuff". If you have enough money to buy an A4000,
you certainly have enough to invest in a SCSI-II controller/HD.

>Because Commodore chose to install a low density 800KB drive
>in the A1200 means that software will be distributed on 800K disks
>while every other platform will use 1.44 MB as standard. It is

Wrong, wrong wrong.. Because the disk is a distribution
method they won't sell as much because of the PIRACY issue.
The Amiga 600/1200 (and via 3rd party for A4000) have the
PCMCIA card, which is an anti-piracy measure, and they will
sell more.. Also, the PCMCIA cartridge will load much faster

than a disk I suspect..

Why did Atari start loosing software vendors originally??
Does anyone remember the ST Explorer mag (under D. Ahl 's
tutilidge) that said that PIRACY was killing the Atari
market a few years ago.. Is it going to be any better now?

>interesting to note that if the Falcons were in a LocalTalk network
>setup, data would be transferred as quickly between them as would
>an A4000 user trying to load the data directly from the 'dual-speed'
>Chinon floppy drive! The LAN chip can be programmed to operate
>2-3 times faster, while the A4000 user must wait for promised

The Amiga has real networking standards going for it like ethernet
and Novell.. As you say the "LAN CHIP CAN BE PROGRAMMED"
^^^
Novell, TCP/IP over arcnet or ethernet hardware.. I suspect we should
compare this if you want to get really specific and accurate about
your statement..

As far as the dual speed thing goes, have you actually ever seen a
game yet on a 1.76MB Amiga floppy load, one from Pysgnosis, etc

>future chipset before he/she can use a normal 1.44 MB drive found
>in all other systems.

Who really wants games that aren't complex enough to be installable
on a hard drive anyway???

>
>before i dl it...does it require color monitor? is is gem based or text?

It runs on monochrome - I didn't try colour. I got mail from a user in Sweden (hi Stefan!), telling me it works, but colour support seems to be limited. If I remember correctly, the 3.0 atari version of nethack had an option to customize the colours if you weren't playing on monochrome. I'll check this out with 3.0 and 3.1 on my TV tonight. BTW, it *does* make a difference whether you have the 'color' option set when playing in monochrome as some chracters will be displayed in reverse. I prefer to play with nocolor and hilite_pet set, but of course it is a matter of personal preferences. All the options can - as usually - be set in the game while playing, in the file nethack.cnf, or using environment variables. (There are a few exceptions, some of the options must be set at start time and aren't permitted to be changed during the game.)

It is not gem based at the moment, but it does recognize the screen resolution. For example, your inventory will always be displayed as far to the right as possible - Mike Brandt, the guy who compiled it (sorry, I forgot to give him proper credit the first time), runs it on his TT in 1280x960 and when the inventory is listed, it does not overwrite the map as easily as it does on a standard 640x400 monitor.

Mike certainly is an ST/TT/nethack addict and also happens to be the local C guru. When he unexpectantly arrived with the 3.1 archive yesterday, he disclosed that he wants to write a gem interface for nethack. He hasn't yet begun, though, and it may take some time to do this, so don't expect it to be ready too soon. Making nethack run in a gem window is in principle a great idea, but I guess all the non-Multitos ST users with 640x400 screens (including myself) will want to stick to the tty display as it is now, simply because we need every bit of space on the screen that's at all available :-)

One more thing of general interest - nethack 3.1 *can* be run from floppy but the executable must obviously be compressed with pfx-pack or anything in a similar vein. Still, non-harddisk owners may have trouble compressing the binary while having a large ramdisk in memory at the same time. If there is serious trouble with file sizes, send me a note, and I'll put a pfx-packed copy of the binary on our ftp server as well.

So, it's a typical Atari product... late, with a crummy manual and not
enough software.

Hopefully, things will improve; then again, Atari hasn't really tried to
make any of its computers successful since the ST...

This is definitely needed. The lack of timely hardware releases (courtesy of Atari ignoring the "real world") and the lack of new software releases (courtesy of Atari ignoring their developers and, in some cases, insulting and threatening them) results in a great deal of frustration among the user base. Occasionally, after answering the same question about the same old software for the nth time, a frustrated user will wonder what the point of all this is...

I made this mistake, and asked for reasons to stick with Atari's new computer, the Falcon. This sparked a small (by net.standards) flame war, which is dying down now, after about two months...

IMHO, comp.sys.atari.st.advocacy will help to reduce the number of "content-free" postings in comp.sys.atari.st, and redirect those postings to a more appropriate place.

>with books, articles and software development. I am *NOT* going to give away something
>for free -- at least not a project that consumed a lot of my time in the past five
>years (not to mention that I am only one of the three authors).

I would not mind if you, Sybex, or anyone else translated the
Profibuch for profit. But it bothers me that the Sybex people
just sit on their copyright. They make neither use nor money out
of it, and prevents others from doing so in their place.
That's why I, and probably others too, are bitching about the
copyright concept. Copyright holders want money for nothing, and
they get it. Even translating stuff seems to be too much work,
even though they could make more money by doing so.
I personally don't think that copyright is a viable concept in
the long run at all, but for the time being, the least thing one
can demand is that copyright owners should be obliged to make
good use of their copyrights. Otherwise, others should be allowed
to do so. The way Sybex seems to use their copyright on the
Profibuch strongly reminds me of someone who owns flats, doesn't
need them, and refuses to rent them to others in the Germany of
today.

2023. Can I use an Atari 1040 ST on a Macintosh network? etc.

Newsgroup: comp.sys.atari.st
Date: 1993-02-02 15:06:41 UTC
From: ashwin@pravda.gatech.edu
Message-ID: <1993Feb2.150641.28029@cc.gatech.edu>
Source record: 210912
Cross-posted to: comp.sys.mac.apps,comp.sys.mac.comm,comp.sys.mac.system,comp.sys.atari.st.tech,comp.sys.atari.st

I have an Atari 1040 ST (without a hard disk) and a Macintosh IIsi (with one). I was wondering whether I could (and if so, how?) --

i) use the Atari as a Macintosh through some kind of software or hardware emulation package. If so, which one is good? (Another thought: Are there IBM-PC emulators for the Atari as well?)

ii) use the Atari-emulating-a-Macintosh on an AppleTalk (or other) network to talk to the Macintosh-being-itself.

iii) use the Atari as a "terminal" and connect to the Macintosh IIsi (which would then run in two-user mode).

iv) use the Atari as itself but have it use the Macintosh's hard drive as a file server.

v) any other ideas?

Thanks,
Ashwin.

You've got to convince the publishers before they will spring for an English version, Mike. And quite honestly, I find that a dubious proposition during these tenuous times. However, if Julian (or someone) would be so kind as to post the publisher's address, a few (or rather, a _bunch_ of) letters might convince them it's worth a go.

>Thanks for any replies
>s112397@umrvma.umr.edu Sam Groves(: As If You Cared :)

G'day, Bug (er, Sam)... and of _course_ we care! :)

1) Personally, I would not recommend upgrading your 520. Donate it to charity
and take a tax deduction, if you can. Look at the for sale messages here and in
misc.for.sale.computers and you'll find that used Atari equipment is _very_
cheap right now. Or you can buy a brand new STe for not much more. If you are
hardware oriented, you could install a home brew memory upgrade for peanuts,
but you still need an updated TOS and a new floppy. I'm not a very avid gamer
but most of my old stuff still works on my MSTe although some must run at 8MHz
or with the cache turned off. If you've outgrown the 520, replace it.

2) Without a doubt, the single most productivity enhancing addition you can
make to your system is a hard disk drive. It will literally change the way
you use your system and make you wonder why you didn't get one years ago!
Hard disk prices are coming down and used drives are plentiful as well. The
single most cost effective upgrade, IMHO, is a TOS upgrade from 1.0 to 2.06.
This one change will dramatically improve your desktop, disk reads/writes, etc.

These are just _my_ recommendations... your mileage may vary. :)

>sound like much, let me rekindle the Atari/Amiga war by saying, the best
>ATonce available for the Amiga is a 286.

Actually, I doubt if it really upset anyone much, since the Amiga is an
open architecture box, there are substantially more PC emulation cards
for it. The ATOnce 386sx might have not been released on the Amiga due
to competition from other superior products. Off hand, I can think of at
least 3 386sx boards and 2 486 boards for the Amiga. It's really a dead
issue.

Ob Atari: Hopefully, Atari will make a more workstation-like Falcon
model with an 040, an actual 32 bit architecture, detached keyboard,
and built in expansion slots, and sell it for a reasonable price.
That'd be much more useful than the current Falcon/030 (for users like
me) which seems to be basically a NeoGeo-killer with MIDI support :^)
Are there any rumors of such a future product?

>where I can do that well!!!
>
>So, IBM must have 4*156000000*1600 dollars. ie. ONE ENGLISH BILLION DOLLARS,
>just sitting in the bank.
>

I think you mean a Trillion.. Anyway.. IBM does NOT have 156 million employees.
350 000 is more like it.
1989, IBM had a PROFIT (after all expenses) of 6 or 9 (can't remember which)
BILLION dollars... Now, figure that they have been piling up numbers in that
area (ie the billions) since the mid 60's... 100 BILLION is NOT impossible...
So, while IBM has a tons-o-lotsa-whole-buncha-mega-mega-much cash, they don't
quite have that many employees...

Sorry to contradict you, but the F stands for Floppy.. The M stood for
frequency Modulator. Thus, my 1040 STFM has an internal floppy AND a modulator.

|> larry.o.imm@uwrf.edu

The radio button attribute affects all items with it set IN THAT SECTION OF THE
TREE. So if you want two sets of radio buttons, you define invisible parents to
surround the different sets of radios boxes:

++=======================================++
|| ||
|| ................. ||
|| Confirm deletes . RADIO1 RADIO2 . ||
|| ................. ||
|| ||
|| ................. ||
|| Confirm overwrite . RADIO3 RADIO4 . ||
|| ................. ||
|| ||
++=======================================++

Hope that helps!

[assuming you know the original message]

1) Yes you there is a MAC emulator, Spectre GCR. There used to be another but that was long ago.

2) No. If you had a MegaST and the Mega-talk board then supposedly you could.

3) Sure any terminal emulation package

4) No. Many problems here, the least of which is the Mac's file names.

Brian

2033. TOS 2.06 Upgrade Error

Newsgroup: comp.sys.atari.st
Date: 1993-02-02 17:30:06 UTC
From: rossin@hpfcso.FC.HP.COM
Message-ID: <7340121@hpfcso.FC.HP.COM>
Source record: 210922

Early this month I posted a description of how to upgrade a 1040ST to TOS 2.06 for the price of the ROMs plus a dollar. Well thanks to Arthur K Whitney I now know that I made a pin number mistake. The DTACK pin number is 31 not 50 on the GLUE chip. I uploaded a new version (2.0) of the upgrade to the archive that should be available soon. Anyway use 31 not 50.

Sorry

Ted.

PS. Art did get the upgrade to work.

When you say the future is not in computers, what do you mean?? Do you mean as in the selling millions every year, etc, or are you saying that the computer as we know it will die out?? I hardly think so.. Industry now has a NEED for computers.. Also, who will program the CD-I & VIS??? As far as I can remember, the CD-I was being touted as the next big thing 3 years ago..

Having 2 different formats will only hurt the entire industry..

However, the way we input data will change.. I look forward to the day when I don't have to type anymore :-)

>
It seems quite reliable although the originators STILL have not fixed the timestamp (-t) qualifier on TOS Versions < 1.4. There have been mailings however from people who had troubles when using STZIP to archive huge files and/or huge directories. Since then there has been another release that cured some bugs.

>3. ZOO 2.1 with high-compression mode (zoo ah foo.zoo files....)
>gives better compression results on most files.
>
NOT IN MY EXPERIENCE! (stzip -a -edb foo.zip files...) wins nearly every time over "zoo-high" and is quicker at compressing. Are you sure you've been using the -edb option?

Finally what do you archivers think of submissions packed as a self-extracting archive using zip2tos.ttp? I guess the same - as that also cannot be unpacked under UNIX. But these must be marvellous for the recipients.

Who said anything about it being PD anyway? I have the magazine in question, but haven't bothered to look at it as I have seen an example of what can be produced with STOS 3D, and it was *horribly* slow.

>was rather slow.

Just out of curiosity, did you get away from the 'bird in a cage' demo? I was unimpressed by that particular demo. I found the other demonstrations, including those of current software packages available to be a bit more impressive.

>On the $500-600 TV/monitor, the graphics were _very_ __VERY__ blurry.

Different stores, different monitor/TV, different impression.

>If anyone was going to spend the $800.00 on the unit and $70.00 on each
>game, he'd be crazy not to fork over the extra $300. for a monitor.

Actually, the pricing for CD-ROMs was more like $30.00 according to the salesperson I talked with later. We'll see.

>All in all, the VIS is too young to take over the computer world.

It won't take over the computer world. It will simply replace the concept of 'home computer' with 'interactive CD-ROM system'. Those people who don't know how to type, who own a good TV set but don't have the faintest idea what the term 'monitor' means, who's children own Nintendo and Sega Genesis units, who really like the idea of a 'complete encyclopedia' included free with the purchase of a audio Compact Disc player, who could care less about programming or keeping their checkbooks straightened out ... THESE are the people who are going to buy CD-I/VIS systems. And there are a lot more of them out there than there are prospective home computer owners.

A large number of TV owners have bought Vide Recorders. These people are the target market for interactive CD-ROM. They are also the purported target for the computer industry, although corporate purchases appear to account for almost all of the Intel-clone/Macintosh computer purchases to date.

>And dispite what you believe, It needs a keyboard (or some kind of voice
>recognition system....) or it can't be expanded like a computer can.

Consumers don't want the system to 'expand'. If the system does what they expect (and they think they need it), they'll purchase it. We're not talking about computers anymore, at least in the sense of the 'personal desktop computer'. We're talking about dedicated application machines ...

Of course, one could probably program a 'console' system such as the Falcon to process CD-I/VIS discs ... food for thought.

Could you elaborate on what fantastic thingie an "8 bit plane" is and in how
far the A1200 suddenly has a "3 bit plane per color" ?

If you mean that the Falcon graphics use either byte or word oriented chunky
pixels this is correct.

The A1200 can have 1,2,3,4,5,6,7 or 8 bits per pixel.

Hi,

I've done some C programing at work on Sun workstations and PC's and would like to carry this on at home on my STe.

Anybody got any tips for which C package (compiler, linker, debugger ..) to use ? Ideally I don't want to spend lots of hard earned cash at this stage, but ANSI compatibility would , I guess, be handy.

While we're at it - anybody know of a decent resoucre editor to use with C and other .RSC files ?

Thanks,

>incarnation of what an arcade game should be.
>
>--Raist

Something doesn't sound right. If you're using a VGA/SVGA
monitor, then 640x480 mode won't be interlaced.
However, if you're on a TV set or SC1224 monitor, then it probably
would be interlaced. Depends on your setup. My impression was that
the only thing you might not be able to do on a VGA/SVGA monitor is
Overscan. Depends what you need, I guess...

I have my SVGA multisync ready and waiting... :-)

As for the Amiga outperforming the Falcon for games - exactly
how fast does a machine need to be to play Donkey Kong or
Dungeon Master, or even Super Mario, etc?

If you like a 1200, buy a 1200. If you like a Falcon, buy a
Falcon. Whatever your needs are.

2047. Using Slip with sticp

Newsgroup: comp.sys.atari.st
Date: 1993-02-02 19:51:43 UTC
From: psurge@cs.utexas.edu
Message-ID: <lmtk6fINN52h@levelland.cs.utexas.edu>
Source record: 210936

I am using NET.TOS which I got from the sticp.lzh file that was mentioned earlier in another post. Is there anyone else out there using this package, or one like it? (I found 3 different ports). This is a port of KA9Q.

1. My ftpusers file looks like this:

```
psurge * a:\ 7 c:\ 7 d:\ 7 e:\ 7
anonymous * e:\public 1
```

Now, if I log an FTP session with any name but the ones above, the connection is denied, which is normal and I know that the file is being checked. However, if I use the username "psurge" or even the "anonymous" user, all transfers and directory listings are denied. I have used the format similar to what is in the provided ftpusers file. Has anyone else had this problem and what was done to fix it?

2. Is there any way to use a domain name server instead of having to know all the servers before hand, and especially their numbers.

Thanks,

Troy Carpenter

2048. Re: Upgrades - Do I Dare ?

Newsgroup: comp.sys.atari.st
Date: 1993-02-02 20:02:44 UTC
From: phruby@ucrengr.ucr.edu
Message-ID: <25694@galaxy.ucr.edu>
Source record: 210837

I see your problem. If you wanted to upgrade your 520STfm to 4mb, this would cost you quite a bit. I remember when I upgraded my 520STfm to only 1mb it cost me $100. Now I'd say you could upgrade your ST to 4mb for about $300 (i'm guessing). To upgrade from TOS 1.0 to 2.06 you would need TOS Extension card from Codehead Tech. Don't know the price on the card but TOS 2.06 goes for about $60. I believe this card lets you switch between your TOS 1.0 and TOS 2.06. What I would do is keep your 520STfm and buy a STE. I was able to buy mine with 4mb and TOS 2.06 upgraded for $600. This way you get 4096 colors, stereo sound, a Blitter chip and other things. You are now compatiable with most all new software. As for your old stuff, there are newer and better versions of most of your software advailable though FTP and us users. Just ask!

As for a hard drive. Get one. Pure and simple. They make life sooooo much easier. You'll be amazed at the speed and the luxury of having all you most used files in one place and not spread over 300 floppy disks. Hard disks are relatively cheap nowadays. Get one from either ICD or Toad computers.

By the way, does your ST have a single or double sided floppy drive? Mine was one of the last to have a single sided drive. Double sided drives are only about $45 dollars and are easy to install. Again just ask for help. I hope this helps.

Paul

Yes it does...I believe it was shown at NAMM. I would contact Barefoot Software (used to be Hybrid Art's) about the upgrade. If you need their number mail me and I can find it for you.

Are there any Compress.ttp programs that are compatable with unix compress?
I ftp'ed a .Z file from my unix account, and when I tried to use the
compress.ttp utility that I have, it told me that the file was compressed with
16 bits, and that it could only handle up to 13 bits compression.

Is the a compress.ttp that will handle 16 bits compression?

>just one. Add to this the fact that most 32-bit fetches are for the

Yes, but since the Falcon is crippled by a 16 bit bus it is no better than the 386sx. Although the processor is a true 32 bit processor tying it to a 16 bit bus doubles the time to fetch a 32 bit word.

>instructions themselves and it becomes clear that clock speed does not

>magazines, though measurement by MHz is useful for comparing different
>PC compatibles.

Actually MIPS is not a good measurement of performance across processor families. Whetstones is compiler dependent. Most benchmarks are not good for comparisons across processor families. Currently the best of the benchmarks is the Spec. MHz is somewhat useful when comparind a '030 to a '386. Assuming that both processors are roughtly equal at the same clock speed and ignoring any differences for compiler technology it is safe to assume that a 386sx at 25MHz is faster that a 16MHz '030 tied to a 16 bit bus. This is raw processing of data only. Operating system overhead along with how well an application is written will determine the actual winner in speed.

>To build a PC equal to the Falcon you would need at least a 80386DX
>based PC, clocked at 33MHz - the high clock speed being needed to
>compensate for the speed loss because of DOS and the BIOS. You would

Wrong. More like overhead of Windows if you wan't a GUI. Command line
programs for DOS run quite fast. The BUIOS is only used for input/output
and can be loaded into RAM. The Falcon and everyother computer has
something equivalent to the BIOS on a PC. You can call it device drivers
in UNIX, or inits on the Mac, but you have to have some kind of software
to talk to your peripheral devices that hands around so all programs
can use them.

>also need a fast VGA video card (since the cards fitted as standard by

THe Falcon comes with lots of memory?

>the region of 1,500, for which you could have a Falcon plus lots of
>extras.
>But I was forgetting, the Falcon also contains a DSP 56001. This chip
For the $1500 price tag I can definitely get a PC with a sound card with
a DSP. Also note that a fast VGA card for windows can be had for less
than $150. Also note that the Falcon does not come with a monitor.

>is not just for handling sound and pictures, but is also a lightning
>fast processor which easily outperforms even a 32MHz 80486 because it
>can perform operations in parallel and with phenomenal efficiency. So

This is very wrong. I did my MSEE research programming the 56K. It is fast
for some very specific tasks used in signal processing, why it's called
a DSP (digital signal processor) but it is by no means a general purpose
CPU that can be used for a whole host of applications. Unless you want
to do some real time filtering of digital audio, or some fixed point array
processing, forget about using the 56K.

>maybe those PC owners who want the sheer processing power of a Falcon
>had better wait for the 80586 50MHz to come out......"

This guy should get a grip. I'm not knocking the Falcon but it is not the
"be all, end all" solution to computing. Note that the original NeXTcube
had a 25MHz '030 and 56K and that was 3.5 years ago.

Wonder of wonders, I open up a copy of the February 1993 issue of COMPUTE magazine and learn this little tidbit from the Editorial Page:

"Modular Windows is simply a subset of Windows 3.1 that's burned in ROM so that it can be used with home video systems or personal digital assistants. Modular Windows is the foundation of Tandy's new VIS home entertainment system."

And for those out there who've been snickering at the 16-bit data bus on the Falcon: "Both Windows 3.1 and WFW are 16-bit versions of Windows. With the exception of one 32-bit magic trick, both operating systems move data 16 bits at a time even on the latest 486 screamer."

Horrors!

2054. Atari ST system for sale

Newsgroup: comp.sys.atari.st
Date: 1993-02-02 23:49:55 UTC
From: rxg3321@ultb.isc.rit.edu
Message-ID: <1993Feb2.234955.22951@ultb.isc.rit.edu>
Source record: 210850
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.hardware,comp.sys.amiga.advocacy

I have an Atari MegaST2 for sale

features:
* upgraded to 4 megabytes
* TOS 1.4 roms
* sm124 monochrome monitor (will sell seperately if the
situation warrants it)
* cable for connecting to a SONY KV1311CR monitor (won't mean much
to most people, so hang your cat with it, I don't care)
* 2 epyx 500xj joysticks. (only good if you're right handed)
* shoebox hard drive case with ICD host adaptor and software.
* lots of software, many games. Here is a partial list:
NeoDesk 2.0 (I haven't upgraded yet, but you can)
QuickST (again, not upgraded to warp9, but you can)
Dungeon Master
Chaos Strikes Back
Captive
Deuteros (seems to have a bug in it, I haven't spoken to
activision, and I haven't heard anything on the net)
WordUp 3.0 (don't use this unless whoever owns the rights to
the software decides to fix the bugs)
WordFlair (much better)
G+plus
Lemmings
Klax
Populous
Power Monger
Tower of Babel
a terminal program whose name I forget. Not Flash, the other
one.
lots of pd and shareware including Uniterm, Llamatron,
and others.
and the ever popular Manny Moore
I have at least twice what is listed here, but I can't remember
the titles offhand.

I have only one problem with the system. The keyboard has suffered a few
injustices. Every key works, but a couple of keys aren't firmly attached
and the tab key is missing. (the little button under the key works, and
this doesn't present a problem at all.

If anyone wants a (fairly) complete list of software, I will be able to get
them after the first week in March.

price: $1000 OBO + shipping

>name of it). It's been awhile since I've used my 2600, so you could
>probably understand my amnesia on this. If anyone else can elaborate
>or remember this controller...

The controller was almost exclusively used in the game Indy 500.
It is basically a 1-dimensional mouse, or "thumbwheel", therefore,
it could very easily be used on the ST series, the only possible
doublt being where the ST's ports can handle the throughput (for example,
they cannot handle the throughput of a mouse connected to the joystick
port - because the IKBD cannot send data to the CPU fast enough).

Anyone still got one of these controllers (they were one-per-port, unlike
paddles which were two-per-port).

All ya gotta do is compress it on the unix at 13bits compression. The format is "compress -b XX [filename]" (XX in this case is the number of bits...) To my knowledge, there isn't any compress on the Atari that handles 16bit (at least none I know about). Anybody out there know if there is one?

Sorry to be so uncordial. Where are my manners. When I posted my
article on Spectre here a while back somebody wanted to know
who I was. Well, I've been having problems making a signature file on
the VAX here so I put it in manually when I dial in from my Mega STe.
When I posted the article I was in the lab.

For your info:
I have been using Spectre for about 2 years now but have been
aquainted with macs for over 5 years.
I have enjoyed using ATARI products since the 8-bit days!
I like Macs and ATARIs (Yes, it is possible!).

I am a Printing and Applied Computer Science undergraduate at
Rochester Institute of Technology.

How's that?

Now my signature for those who missed it:

Anyone considering writing games and considering doing it on a Clone
should read the messages in rec.games.programmer for a while.

I find it hard to believe, but lots of people talk about
"virtual paging" there. You know what that is? IT'S COPYING THE
SCREEN MEMORY FOR EACH PAGE FLIP. Isn't that ridiculous!!!
Give me the Atari ST (or 8bit, even Amiga) any day - where we
can have any number of pages in memory and flip instantly between
them just by changing a pointer.

I demoed all of the software. I was not that impressed. The encyclopedia
was nice. But for $800, no. The thing that turned me off the most was
the graphics. They claim to be a multimedia device, but they can't even
match the graphics of the ST. The animations crawled. A multimedia
device is suppose to have good graphics and colors, the VIS did not.

>>And dispite what you believe, It needs a keyboard (or some kind of voice
>>recognition system....) or it can't be expanded like a computer can.
>
>Consumers don't want the system to 'expand'. If the system does what they
>expect (and they think they need it), they'll purchase it. We're not talking
>about computers anymore, at least in the sense of the 'personal desktop
>computer'. We're talking about dedicated application machines ...

If it wants to take over the home computer market and not the video game
market it sure does. To use any kind of application, like check book
balancer, a simple word processor, the easiest of data bases, one needs
a keyboard. The game pad is not going to cut it.

A home computer is more than a game machine, it is a device which can be
used my mom, dad, and the kids. This unit has to get away from the
Nintendo like graphics, the Seirra type animations and the game pad as
it's input device. A mulitmedia computer must exceed in the graphics
department. I cannot call the VIS a mulitmedia machine. A Nintendo on
steroids, but not a mulitmedia machine. MY THOUGHT though...just mine.

2066. Spectre GCR: Knowing What To Do Part II

Newsgroup: comp.sys.atari.st
Date: 1993-02-03 02:40:38 UTC
From: mrz5149@ritvax.isc.rit.edu
Message-ID: <1993Feb3.024038.25679@ultb.isc.rit.edu>
Source record: 210950

Well, now that we're all introduced I have a tid bit of info to share.
Someone mailed me a message about a problem that I'm sure every
Spectre user faces. I responded to the person in private but I think
the question is good enough to be shared.

- How can I get my dot matrix printer to work with Spectre?

Well, all Mac printers are serial devices but when you operate under
Spectre you can choose weather or not you want the serial port or the
printer port to get information when the Mac system software prints
something out to the printer.

Since most Mac owners have only mac printers there has been little
impetus to write a driver to support other types of printers.

However, there is a printer driver publicly available called "Chuck's
Printer Driver" and it allows you to use your printer. You can get
a copy from mac.archive.umich.edu in the mac.ftp directory (actually
in another directory inside mac.ftp. I don't remember which one).
When you've un-BinHex'd the file and un-Compressed it, you simply
copy it to your system folder. To use it you have to have the
Chooser desk accessory active. Select the chooser desk accessory and
the Chooser's window will pop up. Chucks printer driver is actually
two files, one for 9pins and one for 24pins. The icons for both will
appear in the window. Select the most appropriate one for your printer
and close the window. However, there is a configuration button available
when you select one of the icons. The configuration dialog is to
configure the Mac serial port. Don't worry about the configuration
since you're printing to a parallel port. If you really want to look at
the configuration, just make sure that the speed is at it's highest
(19.2k baud).

Once you have one of the drivers installed, you can print from most any
application just by selecting "Print" from the file menu. When you do
the Chuck's Printer Driver dialog box will appear. For most applications,
you'll want to select "Graphic High" printing. If you're a 24-pin
printer user and you just want to make a quick draft, select "Graphic Medium".
I don't suggest using any of the other modes (like the Text only modes) since
most Mac programs usually print out data in graphic form. Graphic Medium
is not very good for 9pin users and Graphic Low is just plain useless for
everyone!

A caveat for 24-pin users:
This driver doesn't support 24-pin printers very well when it comes to
bitmap graphics (like MacPaint, etc.) because the print out comes out
in a 1-1 fasion when you print in Graphic high. To print pictures like

the above I would suggest using Graphic Medium which is the equivilent of
a 9-pin printer in Graphic High. Use Graphic High for Vector Graphics
and Text. I suspect that "Chuck" made the 9-pin driver to emulate a
Image Writer and the 24-pin driver as a patched 9-pin driver. Too bad
he didn't try to implement a driver like the Style Writer's driver
(which has the same resolution as most 24-pin printers but doesn't
suffer from the above problem!).

Cosmetic Problems:
The driver's "Print" dialog box is smaller than the standard ImageWriter/
LaserWriter "Print" dialog box so some program's print options may be
cut off! To cure this problem do the below but I would only recommend it
to more advanced users.

Fixing The Small Dialog Box:
The driver's dialog box is easy to fix if you have ResEdit. Just find the
DITL (or DLOG. I forget which) that is the printer dialog (you can't miss it!)
Just streach it out so it's about 1 and 1/2 times bigger than it was and
save it that way. That should cure the problem.

Other Printers Besides Epson Compatibles:
I know that there are some other printer drivers floating around like the
one for the Panasonic Laser Printers (also available on umich archive)
and I think there's also one floating around for the Desk Jet. Just
search Mac.ftp sites as many of the drivers are public domain.

SLM Support:
The SLM laser printers are a strange lot and it seems that Dave is
directly supporting them through Spectre. Consult your manual for more
info. (I mean: "Consult your Spectre manual" oops!).

Hope that helps! Happy Emulating! :-)

2067. Re: Tempest for the ST

Newsgroup: comp.sys.atari.st
Date: 1993-02-03 03:18:23 UTC
From: phruby@ucrengr.ucr.edu
Message-ID: <25713@galaxy.ucr.edu>
Source record: 210801

I was just playing Tempest. The game was designed by Paradox software for Atari. The driving controlers from the Atari VCS (2600) work quite well. Joystick control is left and right. Fire button to shoot. Space bar for Super Zapper. The game is Copyrighted 1989. Does anyone know if Atari or Paradox still sell this game? If not, is it in the public domain? I bought mine back in '89. Also does Atari still sell ST Star Raiders or Missile Command? Later!

Paul
P.S. This version is extreemly fast even on my STE.

2068. Re: What's the F in 1040STf

Newsgroup: comp.sys.atari.st

I hope I can provide a little perspective here...

The SuperNintendo -- the one everyone plays StreetFighter II on -- has it main processor running at ~3MHz. I've never seen a game on any computer with the quality of StreetFighter II. (Although I read a few months ago that US Gold [i think] is coming out w/SF II for the ST)

I don't know if this extremely high quality is purely from the programmer or not, but it is definately there, not here.

So...if we're talking about games (popular games -- SFII was/is? the most popular arcade game/home game) your Amiga sucks, My str suck, and your IBM sucks.

If we're not, let's (i'm going to regardless) keep our mouths shut.
(fingers to ourselves?)

>MacX, which is a X-Window server from Apple costs around $220 (US).

Just what I was thinking... For that price, I'd rather write my own server code... I suspect the product won't go very far in the atari market at that price and will either be discontinued or the price will drop... It kind of reminds me of the $300 VT100 emulator software that someone released back in the early days of the ST...

I'll bet the the prices for the other computers were comparable... I can't see it selling well for the PC when there is a P/D X out there already...

MK> Anybody got any tips for which C package (compiler, linker, debugger ..)
MK> to use ? Ideally I don't want to spend lots of hard earned cash at this
MK> stage, but ANSI compatibility would , I guess, be handy.
I would recommend two well done packages (both ANSI conformant):
- GNU cc/c++ and according tools
good compiler, good libs, good tools, free software
but slow compiler, huge executables, needs much harddisc and RAM space
to use

- Lattice C V5.5
well done compiler, good libs, small execs
but commercial product (cost around 400,-DM -> US$ ~275)

MK> While we're at it - anybody know of a decent resoucre editor to use with
MK> C and other .RSC files ?
Lattice includes an Resource Kit (WERCS) or you can get a very good shareware
Resource Kit (ORCS) at a.a.u.e. (I think). Shareware fee is about 50,-DM (US$
~35).

Unforunately, this is market economics at work. It is exactly what
happens in the absence of competition. If someone else were to put out
an X-windows package, it would not only have to be cheaper to compete, but
the competition would force the price of the other X-win stuff down.

So what we need is a PD or Shareware version of X....that would
really bring down the price of commercial X (if it didn't kill it outright,
depending on the quality of the PD/SW software).

warwick@cs.uq.oz.au (Warwick Allison) writes:

[about the ST's joystick/mouse port...]
>they cannot handle the throughput of a mouse connected to the joystick
>port - because the IKBD cannot send data to the CPU fast enough).

This is a minor point, but, assuming he is referring to the
odd behavior of the mouse pointer when the physical mouse is
moved very rapidly, that behavior is consistent with aliasing;
i.e., the keyboard processor is not sampling the mouse state
at a sufficiently high frequency to keep up with quick movement.
This is different from "the IKBD cannot send data to the CPU
fast enough" but not contradictory either (the latter problem
could also exist).
Corrections/additions are welcome, especially if someone knows
the actual mouse sampling rate (and how to increase it!)

>Darren King, GBC

That is correct. The "f" stands for the internal floppy on the side of the
1040's. (Well, at least the one I have.) The "m" is for the frequency
modulator as Paul put it. I don't recall my 520 having the little "m", but
it did allow me to easily hook it up to a TV with what it had on the back of
the machine. (And I have a VideoKey for my 1040 so it can be hooked up to
the TV and Stereo as well.)

The SNES has additional processors that implement many graphics effects,
like scaling and rotation in hardware. The CPU speed is not nearly as
much an issue in its case.

Matt> So...if we're talking about games (popular games -- SFII was/is?
Matt> the most popular arcade game/home game) your Amiga sucks, My str
Matt> suck, and your IBM sucks.

Huh? Just because one box has a superior *implementation* of SFII
doesn't mean it's a better game box, in principle. It could just mean
that the software developers that did one (SNES - CapCom the actual
designers of the arcade game itself.) version of a program simply did a
better job than the others (ST/Amiga/PC - US Gold?).

For example, one advantage that makes the computers better is the
external mass storage they have that is readily available. That's just
starting for the consoles and is still a way off for the SNES
specifically.

OK, I read the FAQ list first - nice FAQ list. I have a question that I didn't see answered there, and I hope someone here can help me.

I want to buy a home computer. I've had two in the past, an Apple Mac SE and an AT&T Unix-PC (also known as a 7300 or a 3B1). Now I have nothing and want something. I notice an abundance of Atari ST type machines in the used-computer ads around town.

What I want to do with a home computer is basically run unix stuff. I'd spend most of my time using an emacs style text editor, running TeX, or running (g)awk. I'd also like to have graphics capability (fairly simple for example what you can do with GNUplot.)

My question is: what can an ST machine (i.e. 8 MHz 68000 and about 1 MB memory) running MiNT or minix really do?? Can it run TeX? awk? emacs? GNU Emacs? Does it have virtual memory? I tried minix on the Mac (I think also at 8 MHz) and was really disappointed. Yes, I do realize that minix on the Mac is not really an OS but a program. Is it different on the Atari?

I know there are these new 68030 machines running at around 16 MHz, but for the price it seems obvious that if I have to go that far, I might as well get a 25 MHz 486/DX machine and run linux - about twice the speed for the same cost.

So, please let me know what I can expect for performance from an ST machine. Thanks very much for any comments.

JT

No problem at all. CoNnect will have an english manual in about 2 months.

> Damn, why didn't the author distribute it as a complete tree! (like a

You obviously use a very old version of Connect. The newer ones are
archived in lharc archives including the tree structure.

>And also, the Amiga 1200/4000 outperforms the Falcon in practically any
>incarnation of what an arcade game should be.
>
>--Raist

anisko> Something doesn't sound right. If you're using a VGA/SVGA
anisko> monitor, then 640x480 mode won't be interlaced.
anisko> However, if you're on a TV set or SC1224 monitor, then it probably
anisko> would be interlaced.

You clearly do not understand what interlace really means. If the signal coming out of your box is interlaced it stays interlaced, the display device has absolutely nothing to do with it. As a matter of fact, the interlacing will probably be more noticeable on a multisync than on a composite monitor.

anisko> I have my SVGA multisync ready and waiting... :-)

You wasted your money apparently ;-)

anisko> As for the Amiga outperforming the Falcon for games - exactly
anisko> how fast does a machine need to be to play Donkey Kong or
anisko> Dungeon Master, or even Super Mario, etc?

Those are all antiquated games by modern standards.

As more and more colors become standard in games, the ability to move and manipulate *lots* of data rapidly becomes important. This is why it is frequently desirable to have additional processing power available to alleviate the burden on the CPU so it can be freed up for calculations/etc rather than spending all its time slinging bits. (Witness: Amiga AGA Chipset, SNES Mode7 hardware, IBM S3/local bus, 3DO Dual 32bit RISC CPUs, etc.)

Think about a game like Commanche Maximum Overkill. That game has to do tons of calculations (3d gfx, game algorithms, etc) in addition to animating an 8 bit VGA screen and as a result, it pretty much requires a ~486/33 to run at a reasonable rate without any gfx hardware assist.

In the near future, I'd expect the standard for a computer game to be considered modern will be at least 640x400@8bits (~256Kbytes of data as opposed to ~64K for 320x200x8) that requires up to a 4x increase in the

machine's ability to calculate and update graphics data just to maintain
it's current frame rate etc.

>>Is the a compress.ttp that will handle 16 bits compression?
>
>To my knowledge, there isn't any compress on the Atari that handles 16bit (at
>least none I know about). Anybody out there know if there is one?
Yes, there is one. We have it in our Atari archive:
utils/compress 910220 dcesz 16 bit compress

We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get '16 bit compress' via anonymous FTP:

Site: ftp.cs.ruu.nl [131.211.80.17]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
file: /pub/ATARI-ST/utils/compress.zoo

--> How to get '16 bit compress' via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.

| Please use a VALID DOMAIN ADDRESS.
| Use 'hip!hop!user' if you must.
| Never use an address which has both '!' and '@' in it.
| Bitnetters use user@host.bitnet

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!sun4nl!ruuinf!mail-server

begin
path fred_flintstone@stone.age.edu (SUBSTITUTE _YOUR_ ADDRESS)
send ATARI-ST/utils/compress.zoo
end

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:

send HELP

A complete "ls-lR" listing of the archive is kept in the top-level directory, it will be updated every night. To get it, issue the command:

send ls-lR.Z

That's all for now. If you encounter problems using the FTP service and/or the mail-server, feel free to drop me a line (by e-mail, please).

There's no way to turn off the processor cache on the Falcon. The manual mentions the processor cache control in the Xcontrol panel, but the option is NOT there (at least in the version they shipped with my falcon). Perhap's someone could tell me exactly how to turn off the cache (I love llamatron, and hate the fact it will not run.....).

Chinese/Japanese/Korean/Other East-Asian Software for ATARI?

A new ftp site is just being set up for Chinese, Japanese,
Korean and other East Asian Software at the "Leibniz Rechen-
zentrum" in Muenchen, Germany. I am supposed to take care
of the ATARI subdirectory.

While there is some Chinese software, I do not know about
any Japanese, Korean or other East Asia related software
for the ATARI.

If you know about any such software, please contact me at

bohn@ldv01.uni-trier.de
or: ucc02ab@sun3.lrz-muenchen.de

Thanks in advance!

Hartmut

P.S. The ftp site is: ftp.lrz-muenchen.de dir: /pub/culture/east-asia

Not flaming any of the answers given, but reading this makes me feel so
nostalgic. It just occured to me that the ST came out in late '85 - nearly
7 years ago, so when I was buying my first ST in 87, I had the choice of
external floppy or internal floppy, and RF modulator or not.

It makes me feel so old that there are ST users out there that only know
about such things from reading about it in a magazine :-)

> sucks.

If Atari wants to move the Falcon, all they have to do is get a
port of SFII for it. (Hopefully Championship Edition!!) I know this game
alone has sold several Super Nintendos, in fact, if I had the money I would
be buying it!! (Both a SNES and SFII, even at $70 for the game)

SFII is the Pac-man of the 90's. My girlfriend even likes the game,
and she doesn't like going into Arcades at all. (That's why when we go to
the mall, I send her shopping, and I go to the arcade!!)

>Give me the Atari ST (or 8bit, even Amiga) any day - where we
>can have any number of pages in memory and flip instantly between
>them just by changing a pointer.

If you weren't aware: You can put the VGA card in a mode that supports real page flipping in 320x200x256color mode. Unfortunately you do lose the nice byte-per-pixel property when you do this, and you have to deal with a similar image format as you have on the ST (i.e., annoying). In fact the overhead you get from having to deal with images in this format is such that it may make sense to stick with standard "mode 13" (byte-per-pixel, no page flipping) and write to a page of VRAM and then copy the whole screen each time. (If you keep your "hidden" screen on the video card, the copy is four times faster than if you keep it in regular RAM.)

This is reminicent of difficulty of doing fine scrolling on the ST -- you have to do all that shifting in software (or at least keep preshifted tokens around which is a hideous waste of RAM). It's much faster if you have a byte per pixel and therefore keep pixels aligned on bounds that the hardware deals well with. (This limitation is corrected in pixel-based graphics co-procesors like the TI34010, which can address at the bit level.)

You can also tweak registers on VGA cards to get a nifty 320x240 mode called "Mode X" that has multiple pages and 1/1 aspect ratio (square pixels). The VGA standard is astonishingly flexible; under X on 386Mach, e.g., you can set your video mode to be essentially any size (in pixels) within the limits of your video RAM and monitor.

It's nice not to be stuck with a few hard-wired video modes! (Not to mention any names. :)

>just one. Add to this the fact that most 32-bit fetches are for the

On a TT, SURE... However, we're NOT talking about a TT.. We're talking Falcon
(or is it Fall-Con????)
The Falcon ALSO only has a 16-bit bus, a fact that MOST people on GEnie have
criticized to no end (isn't that right Tbird ? :-)..
So, in effect, the 386SX and 030 in the Falcon are on equal grounds in that
area. I agree with some of the other comments made.
However, the prices are NOT realistic. For $1500 you get a 4/65 Falcon
WITHOUT a monitor.. For $1500 you can get a 33-386 WITH NICE SVGA monitor &
SVGA card..

2110. Atari for Sale 520ST software/peripherals

Newsgroup: comp.sys.atari.st
Date: 1993-02-03 17:29:37 UTC
From: KOLEDA_K@msb.flint.umich.edu
Message-ID: <MAILQUEUE-101.930203122443.288@msb.flint.umich.edu>
Source record: 210830

FOR SALE: ATARI ST system, peripherals and software.

Hardware:
Atari 520ST ...
External DS/DD drive, Atari SF-314 ...
Mouse, Best Electronics ...
Joystick, Standard Atari (2) ...
Trackball, Atari (needs modification to work as mouse) ...
Eazy-ST 2 Meg Ram Upgrade (total 2.5 Megs) $250
Monochrome Monitor, Atari SM124 ..
Monitor switch box, Astra 90

Color Monitor, Atari SC1224 100
1200 Baud Modem, Atari SX212 20
Hard drive case, 3-5.25 inch bays/power/fan (Tech Spec.) ...
Supra Hard SCSI controller with clock ...
84 MB hard hrive, Seagate ST-296N $350
1-Joystick Wico "Bat Handle" 10
Star NX-10 9-pin dot-matrix printer 85

Software:
WordPerfect 4.1 75
Pagestream 1.8 25
LDW Power 2.0 50
G-Plus, Codeheads 10
Mavis beacon Teaches Touch Typing 15
GFA BASIC 3.5e (January 1992) 50
GFA Draft Plus 10
GFA Companion 5
F-16 Falcon 20
Sim-City 20

Books:
GFA Basic Book w/disk 5
GFA Basic 2.0 Manual 5
GFA Basic 3.0 Manual 10
GFA Basic Programmers Reference Guide Volume I 10
Programming with GFA Basic 3.0 10
Abacus Atari ST Internals 10
Abacus Atari ST Sound and Graphics 5
Abacus Ataris ST GEM Programmers Reference 10

ST-Informer, several years
Atari Explorer, several years
START numersous issues, many with magazine disks
GBUG (GFA Basic Users Group) diskazine, several years shipping costs

Public domain software:
About 25 megs total on hard drive
Much duplicated on floppies Floppies go with system
Including numerous fonts for Pagestream or make offer
Utilities of all kinds
.IMG clipart
.TNY color pictures
Many excellent public domain games
Lots of GFA basic source code Included on hard drive

Everything in excellent condition. No known problems.

I would prefer to sell as a unit, but will split up. Items listed with one price need to stay together. I'd like to keep a complete working system (i.e., CPU, floppy, and one monitor) for last.

Above are suggested prices. All are flexible to some degree, actual shipping charges on most items -- or pickup in vicinity of Flint, MI (about 1 hour drive N. of Detroit).

Please contact via e-mail.

From: davidli@simvax.labmed.umn.edu
Message-ID: <C1vvDK.JnA@news2.cis.umn.edu>
Source record: 210831

In article <1993Feb2.175726.17265@tse.uucp>, mattias@tse.uucp (Mattias Hembruch x0830) writes:
>When you say the future is not in computers, what do you mean??

"Home computers" failed to sell to more than an extreme minority of households in the United States. There are more game machines sold each YEAR than the total number of home computers. [Note, my definition of a home computer is a computer purchased solely for home use, to do the 'typical' home things: writing short letters, balancing the checkbook, playing games, providing educational opportunities to children.... Buying a computer so that you can do work at home means you've purchased a business computer.]

Future home entertainment systems -- applied applications devices, if you will --- will replace "home computers" as a viable market. They may, in actuality, BE computers (or at least they'll contain computer components), but this business of having to learn to type in order to use a computer isn't going anywhere.

Corporate purchases will still provide the majority of computer sales.

>Also, who will program the CD-I & VIS???

An interesting question. The people who currently program for the Intel computer market are already moving into VIS/CD-I. At least one major games publisher for the PC (Sierra) has converted their current software to VIS. Others are sure to follow -- the video game market is going upscale.

>As far as I can remember, the CD-I was being touted as the next big thing 3 >years ago..

I remember the computer hacker fling with CD-I (heck, I remember the RCA/Phillips fight over video discs...). It didn't go anywhere. Phillips decided that if the 'home computer' market wasn't going to do CD-I, they'd have to create their own entertainment system that WOULD. You can go to Sears and purchase the system today. Or you can go to Radio Shack and purchase the VIS system.

The average consumer could care less about home computers. However, a simple entertainment system that would allow them to play video games and get the kids to use the encyclopedia (and also play audio CDs) just might make them want to make a purchase.

>Having 2 different formats will only hurt the entire industry..

I know. Tandy has a bit of an advantage, I guess, since it appears their system is basically an Intel computer running a ROM-based version of Windows while disguised as a CD player. Those who already OWN a computer, and who can

attach a CD-ROM device to a SCSI port may be able to use both formats, if someone out there is smart enough to write the conversion software...

>there already...

Tell that to corporate offices which won't even ALLOW non-commercial software to reside on company desktop computers. High prices are aimed at commercial enterprises, not at home users.

Universities are generally a bit looser with regard to such software, but don't ever make the mistake of assuming that, since software costs more than you'd be willing to spend on it, the seller isn't making any sales.

>My question is: what can an ST machine (i.e. 8 MHz 68000
>and about 1 MB memory) running MiNT or minix really
>do?? Can it run TeX? awk? emacs? GNU Emacs?

You can run any, and all, of the software you mentioned from the GEM desktop of an ST without MiNT or Minix. If you really want a UNIX-like environment, you should look for a 4 megabyte ST running MiNT and any of the excellent program shells (BASH, ksh, csh-variants, tcsh, etc.) A 60 meg hard drive will make things more "comfortable".

I run an emacs-style editor from the GEM desktop, or from a shell. 1 megabyte is suitable for this sort of thing. TeX really needs more memory, and about 15 megs of disk space if you play with MetaFont. GNUplot has been ported to the ST, as have versions of a large number of GNU-ish programs. The GNU C compiler really requires a 4 meg machine. A monochrome monitor (or multisync) is probably the best for the uses you envision.

You won't get virtual memory ... the 68000 was designed well before people thought it might be a good idea for a microcomputer to be able to address virtual memory.

Performance will vary. I've compiled GNU C programs in the background while using GhostScript to print out a PostScript file to an HP DeskJet. The system response time is not nearly as fast as the SPARCstation ELC next door :) Then again, it compared favorably to the response time of a Sun 3/60, and positively beats the response time of a DECstation 3100 with 8 megabytes of memory which is in the process of compiling a lot of GNU C code in an interactive process while also running OSF/Motif.

It appears no one else uses this package, but in case you are following this saga, the problem seemed to clear itself up and now I can FTP directly to my ST from my unix account (that is, now I can read my directories, ftp to and from my ST as well and create and delete files and directories!). Pretty nifty and useful so now I don't have to waste my time at home D/L'ing mucho files, I can do it while I am at work in the background!

>composite monitor.

I was actually commenting from a different perspective. I agree with you
that if the computer sends an interlaced signal, then the screen
will be interlaced (i.e. the monitor doesn't choose).

What I question is whether the *computer* itself ALWAYS sends out
an interlaced signal or not. If it does, then your comments are
correct and noted. Personally, I don't have a Falcon, so I can't
say from experience that it is one way or the other. My impression
from reading ZNET/AEO and checking out GEnie RTC conferences is that
the *Atari* can tell the difference between a TV, a SC1224, and a VGA/SVGA -
this would allow the *computer* to choose the output type. I know there's
a couple Falcon owners out here somewhere - they'd be better judges
as they'd be first hand...

>anisko> I have my SVGA multisync ready and waiting... :-)
>You wasted your money apparently ;-)

I dunno. Works well with my SVGA card in my 286 as well as with
my ST...

Yes. When I bought my first ST in early '86, my dealer could only
obtain plain 520STs (external power-rat and *single-sided* external
floppy and no RF modulator). The 1040ST was still unobtainable.
TOS came on a floppy and furthermore, my dealer only had color
monitors in stock.

Hmmm, not what I was thinking about, exactly, but you're certainly
right given the way I put it. For those who don't know, though, I
guess I should briefly explain what I *meant* to say:

With the 34010 and 34020 (and probably other pixel processors I don't
know about), you load registers with the (X, Y) location of the object
you are dealing with. E.g., for the equivalent of the bit blit
instruction you set up the X and Y registers and then call the
bitblit-equivalent instruction. Similarly for lines (there is a LINE
instruction), splines, etc.

The nice thing is that your assembly code doesn't change for different
screen depths (for the most part). So the same code that works with 2
bit images will work with 8 bit images, without loss of speed. (I'm
simplifying things, but you can get the TI34010 reference if you're
really interested in the details.)

I'd really love to see a personal computer with that kind of graphics
capability as its standard. The chips are less than $100 now, and you
can get boards with 34020's on them for the PC already. (Of course,
that doesn't mean they're intended for writing games!)

Workng so hard at getting graphics fast on the ST (and PC) really makes
you appreciate something like the 34010! If only the Falcon had a
TI34010 instead of a 56000... :-(

Great post, but you're a bit off here -- the 68000 was released in
1979, and hence probably designed in 1977-1978. Virtual memory has
been around since the early 1960's, and even its familiar Unix
implementation appeared in the Multics project in 1968.

In fact there have been almost no significant advances in "hardware
features" since the 1960's. Almost everything you can find on a
microprocessor today was used in 1960's mainframes -- the only
difference is that now you can do those things on a much smaller
scale. Even vector processing units like those found in Crays were
around in the 60's, though back then they only showed up in machines
that were abysmal failures.

Umm, Perhaps you need a review of the FALCON's resolutions.

For people who don't wish to get a SVGA monitor, the FALCON will let you use the standard Atari monitor(s).

If you have a SVGA (VGA too), the FALCON won't be INTERLACED. You get 640x480.

If you have an Atari monitor, the FALCON will be INTERLACED. You get 640x480/2. The ST resolutions will NOT be interlaced.

Source record: 210795

To make the A1200 roughly equivalent to the Falcon 030, you'll have to buy the following: FPU socket $150 (Microbotics empty simm/'881 FPU board), programmable DSP 56001 with I/O port $1000+ (Sunrize), 16-bit stereo A/D D/A $50, SCSI card with 3-4 MB/s spec $200?, Proprietary HD Floppy drive $100, 16-bit Hicolor card $100, 68030 with MMU $50, LAN $50, MIDI $25, 16 Mhz BLiTTER with IDE DMA capabilities $50?, Extra joystick ports $10, VGA monitor adaptor $25, Fan $20, Upgraded 65W power (from 22W) $50. Plus you'll have to get an OS with DIG and memory protection.

Total upgrade cost = ~$1800 (+ $600 cost of A1200) = ~$2400 Total

Since most A1200 owners void their warranties because they are forced to install an IDE drive instead using the SCSI drive most Amiga/Atari users possess, they should be *very* careful when performing their dozen upgrades. :-)

Mostly correct. The ST's mono rez (640x400x2) is interlaced on the TV/SC1224.
As some other post surmised, the Falcon can determine what kind of monitor is
plugged into its video out port and TOS will adjust things accordingly.

All good points. You really can't discount the presence of nice controllers like the Zilog 8530 SCC (provides the RS232 serial port and RS422 LAN port), the high speed SCSI (NCR 5380, as I recall), etc. While very few new PCs are still using the crappy Intel 8250 ACIAs, the performance even with the nicer 16550s can't compare to the speed and reliability of the Zilog 8530s. (I won't harp on the MIDI ports because it really is a valid point that few people will ever use them. However, the serial ports on a PC will tend to get used very heavily, and the hardware driving them makes a big difference. You can drive a PC's serial port at up to 115kbps, but it tends to be very unreliable, particularly using the 8250, and you can't do *anything* else when operating at that speed. You can drive the Falcon serial port about 3 or 4 times faster and not miss a beat, while multitasking.)

And of course, as long as we're restricted to the [E]ISA PC bus, you'll never see more than 8 MHz of available bandwidth there, which works out to maybe 512KB/sec max. So unless you go with a localbus SCSI adapter, your PC is never going to see anywhere near optimal hard drive performance.

Okay guys, don't laugh, okay. My ego's fairly fragile. Here are my questions.

1. What would be a good FORTRAN (yes, you heard it right) to use on my TT?
It needs to take advantage of my 68882 and the 16 MB of TT RAM. I was
prospero FORTRAN is pretty decent. Where can I get it here in the US?

2. There's a MIDI networking program that Fred Brooks wrote on umich that
allow several STs to be linked via the MIDI ports. I tried it couple
of days ago and it didn't work. Anybody else had experiences with it?

3. I've trying anonymous ftp from atari.archive.umich.edu for the last
three nights. Each time, I was kicked off because the number of
connections were filled to the hilt. What's going on?

Sigh, another contentless bitching meta-post. Why I ever waste my
time posting here anymore is totally beyond me.

"Thanks for your contribution; unfortunately we don't have space to
print all the excellent material we receive."

The Mac was released shortly after the 68000, had a 68000 in it, and
featured an *implementation* of a (hacky) vritual memory scheme. If it
weren't already obivous enough that the existence of VM in the early
60's makes it unlikely that VM had not even been considered for micros,
that pretty much puts the argument to rest, now doesn't it?

> designers of the arcade game itself.) version of a program simply did a
> better job than the others (ST/Amiga/PC - US Gold?).

By this point you have completely missed the point of the post.

[...stuff deleted...]

The point was to answer the question (sort of..even more to provide perspective) posed above. Do you remember the question?

"...exactly how fast does a machine have to be to play Donkey Kong, or Dungoen Master, or even Super Mario, etc?"

Read as: How fast a machine (8MHz, 16MHz, 25MHZ, 33MHZ) does on need to play games?

My point: Not a very fast machine is needed to play the best games.

Good luck this time.

-Matt

GO>
GO> I downloaded Powerdos from a.a, bit I can't get it to do anything for
GO> me. There is no Configur file in the archive, & I cant't figure out how
GO> to set it up properly.

Take a hint from someone who has tried, quite hard :

Don't bother.

GO> If there is anyone out there who has or who knows something, please
post
GO> a reply as it certainly looks interesting.

Looks can be (are) deceiving.

GO> Some questions:
GO> 1. Does it work with all versions of TOS.

Probably not with <1.04

GO> 2. What is the difference between it and Mint/Multitos.

Everything 8) ... PDos is a very simple system, providing reasonable
backwards compatability, but few new features. MiNT is a whole new operating
system that just happens to be backwards compatible. (That's simplifying it
a lot, but basically the gist of it)

GO> 3. How much faster are the disk routines.

In version 1.0 they were about twice as fast. Unfortunately, in fixing all
of the incredible bugs in 1.0, this speed was lost, and the current versions
are 10-2)% faster. In my mind, that's not enough to justify living with a
product that is that buggy.

GO> 4. How do you set up the programs to muti-task.

You don't. There are no shells, and unless you want to write your own, there
probably won't be.

Don't get me wrong, I think Chris has done a very impressive job - it's just
that it's not reliable, and he should concentrate on PowerNET and making it
work with MiNT/MTos...

SpeedoGDOS is like FSMGDOS (I *have* Speedo) but, like you say, I want a
scalable font, or else I could indeed stick with FSM or FontGDOS.

>Since BitStream fonts are licensed technology, I don't think you'll find any
>freeware or shareware font editors for BitStream fonts. You might be able to
>find a font editor within the Intel-clone world of software. Good luck in your
>search.

Basically, you are right. But, since the Speedo fonts are included with the
X11R5 release of the X Window System, and there exists source code for font
display within those sources, I guess that one could derive a font editor or
some sort of converter from aother outline or vector font format from this.

Also, I guess that one could use those speedo fonts that come with X11R5, but I
haven't found the time to try this out.

Brian> flexible.

Yeah, I've since been corrected by several Falcon buffs (Thanks to those
who sent me the specification tables via e-mail). From what I gather,
the signal coming out of the box *is not* interlaced when hooked to VGA
monitor because the Falcon was designed to sense the monitor type and
change it accordingly. Sorry to anyone following the discussion for the
misinformation.

Brian> The hardware architecture of the clones needs to change. I am not
Brian> saying dump Intel, but the clones must start using more

Brian> architecture makes a lot more sense today.

I agree completely, for advanced multimedia boxes, a flexible
multiprocessor architecture is needed in addition to the fast CPU's.

S3 local bus gfx cards on the PC's are a step in the right direction.
New boxes like the Amiga AGA machines, Atari Falcons, and 3DO are probably
even better examples of this trend.

^^^^^^^^ That much?

I thought that was the first point: If some guys (from the net) voluntarily translate one chapter, we could send the translated copy back to Sybex (Germany) to publish it; they would only have to pay for typesetting/printing. And if the translators would produce TeX sources, that would be not too much anyway. (The original Profibuch was 300dpi I think, so a TeX printout at 600 (which wouldn't be too

Is the original Profibuch in TeX this time, or is it DTP'd? It would save a considerable amount of time if the translators could easily leave the tables etc. unattended and concentrate on translating the pure text.

The product wouldn't be state-of-the-art Queen's English perhaps, but since the Atari community is not that big, it wouldn't be possible otherwise.

How could there ever have been a Dutch edition (just wondering)? Didn't Sybex loose some money on that one? Or is the Dutch market for Atari stuff not that bad?

>If not, please shut up.

Relax... Take it as a compliment that so many people would like to have your book...

|> and variations thereof. Anyone successfully received a file from this
|> section? If yes...how?

I had this problem a while ago to. The advice from Jeff Weiner at the archive
is to request Sound/Sounds/filename.snd.Z as all the files have been compressed.
You'll obviously need to uncompress them when you've uudecoded the files BART
sends. This needs to be done using uncompress on a UNIX system or use the uncompress
program from the archive (I think it's Archivers/uncompress.ttp, but I'm not sure
'cos as far as I know the index for that area isn't available).

This has worked fine for me.

2158. Compressing nethack 3.1

Newsgroup: comp.sys.atari.st
Date: 1993-02-04 14:42:52 UTC
From: christof@wowbagger.pc-labor.uni-bremen.de
Message-ID: <1993Feb4.144252.9481@informatik.uni-bremen.de>
Source record: 210787

I recieved several requests to put a compressed, self-extracting binary of nethack 3.1 on our server for all those floppydisk-only users. Well, yesterday I tried to compress it, but without success. The program would crash when started after packing. The packers I tried were

Ice 2.3.1
Automation 2.5.1

As these packers do work on other programs, I suspect the size of the nethack binary (940K) was too much for them. I also tried pfx-pack 2.1 and succeeded (the game would run), but then I found out that pfx-pack is guiltware. Also, when I tried to de-pack the compressed binary, it would not come out the original size and crash when attempted to run, all of which rendered me suspicious about pfx-pack.

Could anyone mail me a free, known-to-be-working packer for executables. I know there are newer versions of the packers above, I just don't have them.

Thanks in advance,

Christoph

I'm curious about setting up a Slip connection for my St.. I know there are several programs that will let you do stuff (UUCP, etc..), but what do you need to do this? Any sort of special modem or what? Thanks..

I have a version of Tempest made by Paradox (Tempest, Copyright Atari Corp.)

I guess it's ok, but I just don't really like Tempest in the first place.
I didn't buy it, it came with my ST when I bought it used.

Regards,
Doug Plate

GEM View 2.13 (unregistered version) will convert any of the inputted
pictures (GIF, JPG, and a billion other formats) into GIF format (you
have the choice whether to display it or not). The registered version
will convert to other formats as well (BMP being one of them)...

On this subject, does anyone know an easy way for someone in the
U.S.A (like me) to register Gemview, being based in Germany?
Thanks...

2170. Atari formats PC better than PC

Newsgroup: comp.sys.atari.st
Date: 1993-02-04 19:19:54 UTC
From: mayfiej@ucunix.san.uc.edu
Message-ID: <C1xv16.Kq@ucunix.san.uc.edu>
Source record: 210701
Cross-posted to: comp.sys.atari,comp.sys.atari.st,comp.sys.atari.st.tech

I do a lot of disk swapping between my ST and my PC. I use a number of different devices and programs to format my disks. Recently, I noticed that different disks seem to read data at different speeds. I knew that the interleave of sectors can affect this but I doubted that this was the case for two reasons: 1.the write speed always seemed to be the same no matter which disk I used, and 2.I have never intentionally formatted a disk with a different interleave the default.
I conducted a simple test comparing the formatting, writing and reading speeds of my different devices. To do this, I took four COMPLETELY blank double density 3.5" disks and recorded how long each device/program took to format a disk with 80 tracks, 9 sectors per track (MS-DOS standard). Next, I recorded how long it took my PC to copy three files that added up to 578,293 bytes (564.74 k) onto each floppy and how long it took to read those files from each floppy.
The devices I used were 1.an Atari 520STfm with 1 meg and DS/DD drive, a Toshiba T5100 laptop PC compatible and a Roland Sound Brush MIDI file player (which formats/writes/reads IBM format disks). I used two different programs to format on the ST: PS2FORM and DCFORMAT v 3.02. I just used standard MS-DOS protocol to format the disk on the Toshiba (FORMAT a: /f:720). The data are as follows:

Device	Program	Format Time	Write Time	Read Time
ST	PS2FORM	1:23	0:49	0:34
ST	DCFORMAT	1:07*	0:48	0:33
PC	MS-DOS	1:35	0:48	0:41
Sound Brush	N/A	1:07	0:48	0:41

* DCFORMAT requires that you write an MS-DOS boot sector to the disk after formatting if you want the disk to be PC compatible. This only takes a moment, however. Plus, you can only write the MS-DOS boot sector to disks formatted in 'normal' mode (not 'skewed').

Interestingly, the PC took the longest time, overall. Although the write/read results were identical for the PC and Sound Brush, the PC took an extra 28 seconds to format! Of the Atari programs, the write/results were very close, however DCFORMAT took less time to format than did PS2FORM. (Of course, then you have to write the MS-DOS boot sector when using DCFORMAT, so the results are a bit closer. You will notice that ALL of the disks performed equally well during writing, but BOTH of the Atari-formatted disks took significantly less time when READING. This is important, since your computer generally reads more stuff than it writes.
I should note that the FORMATTING results would probably have been

different if I had used disks that were already formatted rather than completely blank ones. Usually, it takes less time to format a disk if there's already stuff on it... USUALLY. (If the disk was previously in a very different format from what your computer's used to it can take a lot longer. Sometimes you even have to erase such a disk before your computer will let you format it!)
I do not know why the Atari programs performed better on this test. Perhaps the Atari just defaults to a different step rate, allowing it to read sectors more quickly. There are other Atari programs that will format in MS-DOS mode, but the others I've tried have either been buggy or have performed very innefficiently (when reading a disk formatted in the MS-DOS mode on my ST communications program, it takes longer than it would to FORMAT!) If you know of any others, or of an alternative PC formatting procedure/program I would very much like to know.

[stuff about tcpip package deleted]

So are you connected to an ethernet line or is this strictly TCPIP over a serial line (and does it require or compete with the KA9Q package)? If it is over a serial line (or modem), what is the advantage to this over say zmodem? Does the TCPIP require that you dialup to a line that specifically supports SLIP lines, or is it much simpler than that (IE does it require much effort on the part of the UoT network people (assuming that is where you are TCPIPing to) to get it to work, or do they even have to know about it)?

Thanks, and BTW, has anyone developed a packet driver for those nifty scsi-port ethernet boxes that are available for the Mac?

I really do wonder who needs a review in Falcon resolutions... I recall
numerous postings (official ATARI ones here) last year (sept/oct/nov)
about the Falcon not being able to display modes that are x400+ in the Y axis
in non-interlaced.

Can someone with REAL information post *again* all the Falcon modes?

From what I read in those months, it said that the Falcon had to go interlace at those resolutions, and no matter what monitor you connect there, you are gonna have flickering.

>PC is never going to see anywhere near optimal hard drive performance.

Howard,

Are you sure about that? I know that I have gotten around 800k/s on
HD controllers, and that was on old RLL drive controllers on a 286. In fact,
if you think about it, if you figure a 5clocks/memory fetch, that would work
out to be 1.6MB/S on an 8-bit ISA bus and 3.2MB/s on 16-bit ISA bus. If I
remember correctly, EISA bumps the bus speed up to 12MHz (or maybe that is
MicroChannel) or 16MHz. Even at the 12MHz speed, with a 32-bit bus and a
5clock memory fetch, that is 10MB/s.

So, you may never see optimal performance on an ISA bus, but you
shouldn't see much performance degredation on EISA (as long as you have the
right configuration files and a EISA config program that is new enough for your
particular machine :)

|>
|>

Hold it there.

Let's make your list of things to buy fair - let's take out
a couple of things you won't need/want:

*16 Mhz BLiTTER with IDE DMA capabilities

While I don't have infor whether the 1200 can do DMA from the IDE
hardisk, the A1200 BLiTTER is more flexible/powerfull than the Falcon's.
Why, has operations that would take more blittings for the Falcon's blitter.

*16-bit Hicolor card -> why? A1200 graphics are much better (see below)

*Fan, upgraded power supply, OS with DIG, etc. -> when the Falcon comes
out we'll see

Now let's go to the things the Falcon must change/add:

*32 bit datapath from cpu to memory -> gee, I guess that you can't buy
one of this

*Separate Video and CPU bus to memory to avoid
video/cpu contention -> I guess you can't buy one of
this either.

*Concurrent DMA operations -> Falcon 68030 halts when DMA is taking place
not such on the A1200

*PCMCIA slot

It's interesting all the people go around taking on the A1200 with the
Falcon, when the A1200 is selling right now and the Falcon isn't.
How can you tell how good is its OS? Good humor.

BTW, GVP announced a new 68030 card @40Mhz with FPU socket
expandable to 32 megs of RAM for a retail of $499. The A1200 is new and
already has expansions available... where's the Falcon?

>
Prospero FORTRAN (TT version--different from ST version) _should_ meet your
requirements (boy, I wish I had 16 MB of TT RAM..... :), but it does have
some bugs and non-standard features. For example,
instead of FORMAT(X,A10)
you must use FORMAT(1X,A10)
This is actually implement the ANSI standard, but most compilers all the
former. And one big bug it has is that some programs just don't run right
(they compile, but...) unless the -g option is included. And there's other
minor one's I can't remember right now. But they may have fixed them by
now, since I got mine last summer and never bothered to send in the
registration. (I was going to send in my list of errors....)

But if it worked all right I'd say it was pretty good--the manual is nice
and big and all kinds of system calls, etc (all the stuff everybody needs
in FORTRAN) are included.

I got it from Zephyr/STplus in Berkeley for $103, which is pretty cheap,
but it took them over _SIX_MONTHS_ to get it to me, though the last update
in the readme file was only a month old (?).

2177. MiNT ... and problems with it...

Newsgroup: comp.sys.atari.st
Date: 1993-02-04 20:19:07 UTC
From: baffoni@phakt.usc.edu
Message-ID: <1krtnrINN59f@phakt.usc.edu>
Source record: 210725

Hi All,

Has anyone had problems running .prgs with MiNT? I tried using the distribution disks but it didn't copy the software over properly so I had to take a go at it by hand.

In fact I've had very strange results with MiNT (ver .95?). It seems that I can run MiNT and get to the GEM desktop (and could use cntl-c to get a directory of drive c: when I added Init=bootgem :) and I can run TCSH from TOSWIN. I can run most .ttps like zoo (yay!!) ls, dir, etc. However, anything requiring screen movement (elvis, CoNnect, and all .prgs) causes a "freeze" - well, the mouse still moves just fine, but clicking on menu items or on GEM control/slider boxes does nothing (sometimes cntl-alt-del works, sometimes not). This same effect happens if I am in TCSH and I hit backspace one too many times (like if I have ">hi" and hit backspace 3 times) - every time.

If it matters, the distribution disk dies after it has copied the files off of disk1 (I think it dies when it tries to run a script, perhaps using sh.ttp and system I think). Of course it probably needs MiNT to be running so that the shell runs while the setup program is running, but since I can't run a .prg while MiNT is active...<sigh>. I can run MiNT and then from TOSWIN (using sh.ttp) run the shell script (sh system.sh), and can even run the do.sh created by the install program (which also cannot be run while MiNT is active) but since the do.sh is overwritten for each disk, I have to reboot, run the shell, reboot, run the install - for each disk. Would it be possible to make a version of the install program so that it presents an ASCII list of options (each numbered say 1-20) that you type then number of each option you want installed, perhaps separated by commas, and then runs - all within a .TTP that can run in a shell? I don't know if the distribution does any file modifications (like modifing mint.cfg to reflect the hierarchy of GCC, or at least the drive it is run on, etc.) but if it does then I know that the setup or install program fail before they can. If this is the case, is there a setup/config value that I am missing that won't let me run .prgs?

My setup is a TT with TOS3.06, 4MBSTram, Q105LPS internal, color, 1.44 upgrade. This happens regardless of what is running as a .acc (although I haven't tried removing xcontrol) or in /auto.

BTW, is Warp9 screen saver compatible with MiNT? For me, the screen goes blank and then it is frozen. Warp9 seems to work fine otherwise (works with .ttps, desktop, etc.).

Any help would be VERY appreciated. Any comments Eric S.?

Tell me about it. When Wolfgang, the author of CoNnect, told me that
you could use CoNnect as an answering machine if you had a Xyzel - my jaw hit
the floor. True, it isn't at 16-bit sound (Hi Howard) but hey, you would have
a hard time transfering 16-bit sound fast enough over the serial line to keep
up with the digitized sound at anything over 8KHz samples (unless you have a
TT or falcon and can use the new ports to go at 38.4k which would allow 18kHz
samples). Anyone know what the sample rate is on the Xyzel?
Didn't Supra say they were working on a ROM that would support this
same kind of feature? If so, I haven't heard about it...yet.

I have a strong dislike, bordering on hate, for self-extracting archives.
Maybe I am paranoid, but like to have a good look at stuff before I
execute it. I have a good set of archive browsers etc, which I can use
to decide whether to unarchive a thing, and to where. I use these on
the most convenient machine of the moment, an ST, a PC or a VAX under
VMS.

>

I am not using TCPIP at all, nor do I know anything about it. If it supports SLIP, then you can use it separately. I see no way to run anything else at the same time, so I guess it competes with KA9Q (SLIP implementaion is local to KA9Q, not a driver).

KA9Q requires SLIP to be running on the server machine. I have no idea what the sys admins need to do to set that up. When SLIP mode is entered, an IP number is provided and your computer becomes a node on the network which can telnet, ftp, service finger inquiries, and do mail. I have not used the mail system, but I have had a telnet session, an ftp session from my ST, and an ftp session to my ST from a local host, as well as doing a finger from my local host (the host I telnet'ted to), all at the same time. Sure transmission is slow in that case, but it is not a normal case.

The big advantage is that I can set my ST up in the morning with an IP number via SLIP, and while I am working at the University one of the Suns I can be getting files via ftp from the archives, deciding which ones I want, and opening an FTP session to my ST to put the files there. When I get home, then all the files I want are waiting, and I don't have to spend my time D/L'ding the files.

The package also has mail service, both send and receive, as well as reply-to rerouting. Since my system does not stay up full time, I do not worry about this feature.

I have not seen newsgroup support.

If anyone else is using a KA9Q derivitive, please tell me what version and what features it has (since there are so many different ports of this program). Also what your setup is.

Message-ID: <1993Feb4.162855.14447@umiami.ir.miami.edu>
Source record: 210720

OK. I am having a problem with UNiterm. I am using version 2.0c and I am having a very hard time u/ling to my host here in Miami. I extend the packet-lengths and set the file type. I also set file type binary. But it just won't u/l. I have tried over 12 times and I keep getting a NAK error when I try to send.

Any thoughts?

thanks

Mark Santora

Ok, I really would have liked to do this in E-mail, but since you asked, here again is the posting from Atari's very own John Townsend (which has since been reprinted in numerous magazines and uncountable times here on the net). These _are_ the video modes available on the Falcon, this really should not be a matter of dispute. And if you didn't want to read all the video modes, the answer is yes, the Falcon _does_ have non-interlaced video at up to 640x480x256 colors.

P.S. - Could someone *please* add this to the FAQ? If it's already in there, I guess there isn't much we can do, but this seems to come up every week or so and it's really an issue that's been decided for some time now.

---------- cut here ----------
The following message describes the resolution modes on the Falcon 030:

Resolutions available on the Atari Falcon030
(c) 1992 Atari Corp. Written by John Townsend
==========
This document may be re-printed again and again as long as the Atari copyright remains intact.
==========

A couple of notes: Unlike previous machines, there are just too many resolutions to give each resolution a name. Therefore, I will do my best to describe what the resolution is and which monitor it is on.

- NOTE: TV and a Color Monitor are the same.. by Color Monitor, I am talking about the standard SC1224. By VGA, I mean a standard VGA Monitor.

40 column modes ("column" means the number of x pixels divided by 8)
---
4 color, normal, TV: 320x200, 4 colors, 2 planes
16 color, normal, TV: 320x200, 16 colors, 4 planes
256 color, normal, TV: 320x200, 256 colors, 8 planes
True color, normal, TV: 320x200, true color
4 color, interlace, TV: 320x400, 4 colors, 2 planes
16 color, interlace, TV: 320x400, 16 colors, 4 planes
256 color, interlace, TV: 320x400, 256 colors, 8 planes
True color, interlace, TV: 320x400, true color

4 color, normal, VGA: 320x480, 4 colors, 2 planes
16 color, normal, VGA: 320x480, 16 colors, 4 planes
256 color, normal, VGA: 320x480, 256 colors, 8 planes
True color, normal, VGA: 320x480, true color
4 color, line-doubling, VGA: 320x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 320x240, 16 colors, 4 planes
256 color, line-doubling, VGA: 320x240, 256 colors, 8 planes
True color, line-doubling, VGA: 320x240, true color

80 column modes
---
2 color, normal, TV: 640x200, 2 colors, 1 plane
4 color, normal, TV: 640x200, 4 colors, 2 planes
16 color, normal, TV: 640x200, 16 colors, 4 planes
256 color, normal, TV: 640x200, 256 colors, 8 planes
True color, normal, TV: 640x200, true color
4 color, interlace, TV: 640x400, 4 colors, 2 planes
16 color, interlace, TV: 640x400, 16 colors, 4 planes
256 color, interlace, TV: 640x400, 256 colors, 8 planes
True color, interlace, TV: 640x400, true color

2 color, normal, VGA: 640x480, 2 colors, 1 plane
4 color, normal, VGA: 640x480, 4 colors, 2 planes
16 color, normal, VGA: 640x480, 16 colors, 4 planes
256 color, normal, VGA: 640x480, 256 colors, 8 planes
4 color, line-doubling, VGA: 640x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 640x240, 16 colors, 4 planes
256 color, line-doubling, VGA: 640x240, 256 colors, 8 planes

and lastly.. there are compability modes for ST Low, ST Medium, and ST High on
both VGA monitors and SC1224 monitors. (On a color monitor, ST High is
achieved by using the interlace mode).

Also, the ST Monochrome monitor (the SM124) will work with Falcon030 as well.
However, it only supports one resolution: ST High Resolution.

All modes on a TV can be overscanned. This means multiplying the X and Y
resolution by 1.2. For example, modes with 320 pixels of horizontal resolution
(X res) will become 384 pixels across, and modes with 640 pixels will become
768 across. Overscanning is done in the X and Y resolution. You can't do them
independently. Special Note: On a VGA monitor, overscan is "faked".. since the
video hardware doesn't have the capability to do overscan on a VGA monitor, we

made it so that if a overscan mode is set on a VGA monitor, you still see the normal size screen, but the screen is a window onto the bigger overscanned image. Make sense? We did this for compatibility. This way if a game that has an overscanned starup picture can use the same pic on both the VGA monitor and the TV monitor. Pretty cool, eh? <grin>

BTW.. Overscan can NOT be set from the desktop. The AES and Desktop will work just fine with it, but because you can't see the parts of the screen, we thought that that option shouldn't be available from the desktop. We don't want to confuse people. However, Overscan can be set using a new XBIOS call (Vsetmode()).. so it is still available.

I hope I haven't made any mistakes. I triple-checked this document in search of errors and I couldn't find any. If you do find some, send me Email on GEnie (to TOWNS) or CIS (70007,1135) and let me know.

-- John Townsend, Atari Corp.

PS. Anyone would would like to reprint this message, please do so!
The smaller the number of times I have to type that message, the
more my fingers with thank you! ;-)

After looking at this one more time.. one point to clear up: By
saying SC1224 Color Monitor, I mean any Color Monitor that Atari
have manufactured for the ST/Mega/STE/MegaSTE computers. Clear
as mud? ;-)

2186. More good news on Atari to format IBM disks

Newsgroup: comp.sys.atari.st
Date: 1993-02-04 22:47:59 UTC
From: mayfiej@ucunix.san.uc.edu
Message-ID: <C1y4o0.BAG@ucunix.san.uc.edu>
Source record: 210711
Cross-posted to: comp.sys.atari,comp.sys.atari.st,comp.sys.atari.st.tech

After posting my findings on the differences between Atari and IBM formatting procedures, I discovered that disks formatted on the ST with DCFORMAT 3.02 leave 2k less to the user than disks formatted on the IBM or with PS2FORM. I was, at first disappointed by this, since DCFORMAT was the quickest, overall in my original tests and I was thus planning to register it and make it my official formatting utility- but I didn't want a formatter that left less free space on the disk than it should.
But then I thought, "Hey, DCFORMAT lets you format up to 82 tracks. I wonder if that would fly on the PC?" So I tried it, and it worked. To test whether my PC would handle stuff on the extra 2 tracks, I filled the disk up with small text files, so that every data block on the disk was occupied. Not only did it copy without error, but the files, when accessed loaded just as quickly as the other files on the disk. Here's a list of the formatters that I tested previously and the amount of free space they leave on your disk:

Device Software	Free Space (in bytes)	Free Space (in k)
ST DCFORMAT (80 tracks)	728,064	711
ST DCFORMAT (82 tracks)	746,496	729
ST PS2FORM	730,112	713
PC MS-DOS	730,112	713
Sound Brush	N/A	730,112	713

So, DCFORMAT 302 gives you 16,384 bytes (16k) more space on your disk (if you format 82 tracks, 9 sectors per track [in "normal" mode!]) than if you format the same disk on a PC with the standard 720k format command.
Now, please note that when you format a 720k disk, you're NOT going to get 720k free space. See, some of the sectors are reserved for booting and for the directory. That is why the PC, Sound Bruch and PS2FORM leave us with 713k instead of 720. Some formatters allow you to change the number of sectors allocated to the boot table and directory, but I don't encourage doing that unless it's really necessary; I've had problems on other peoples' disk drives and computers when I mess around with that stuff.
I am now very impressed with DCFORMAT, and am going be using it for quite a while. (Unless I find something even better!)

Mr. <Electrical Engineer> was fooled like the rest of us. The 16-bit
bus in the Falcon cripples the CPU the same way it does in a '386sx.

Oh, whoops, that'll peeve people. How about this, "The 16-bit bus in
the Falcon makes it much slower than it should be, the same way it
does in a '386sx."? Or maybe, "16Mhz wouldn't be so bad if Atari
hadn't messed up the design and then _LIED_ to us about it being a
fully 32-bit machine."?

Flame me in email please; I don't really want to waste time on the
flame war again.

>enough software.

My Falcon arrived yesterday so here's some random thoughts:

Actually, the Falcon manual is quite nice, surely the best they have managed to date. Sure, it doesn't compare to the huge volumes you may find elsewhere, but it does cover all the points of Falcon operation in a clean, straightforward manner and is quite readable for beginners (the target audience).

What little included software I've seen is disappointing. Although I admit I have not seen D2D or MultiTOS in action yet.

The case is... well, you all _know_ what the case is like, don't you?

It is noticeably faster in all respects to my MSTE. It would further benefit from a software accelerator like Warp 9 or NVDI, however.

Stay tuned... the trials continue...

Shameless commercial plug dept.:

2193. Credit check on "ABC Drives"?

Newsgroup: comp.sys.atari.st
Date: 1993-02-05 01:31:57 UTC
From: frank@halcyon.com
Message-ID: <1993Feb5.013157.651@nwnexus.WA.COM>
Source record: 210604

I was told that this would be an appropriate group to find out about the dependability/honesty of a dealer who will NOT give me his address, but insists on COD or a credit card. Dealing in that fashion would leave me completely defenseless.

So -

Has anyone heard of or about or done business with:

ABC Drives
818-885-7157

??

Thanks in advance. I've queried comp.sys.3b1 where I usually "live" but got no response.

Frank

>>are based around an 8 bit plane. The Amiga 1200 only has a 3 bit plane per
>>color. This makes the graphic handling much harder to manipulate on the Amiga.
Wrong. The 1200 (and all machine with the AGA chipset) have 16 million
colors, and have some modes that allow 256,000 SIMULTANEOUS colors. The 1200
is NOT based on a "3 bit plane system" (perhaps you are thinking of the older
Amiga's?). In any case, most games will make use of only 8-bit screens anyway,
as it will be easier to port IBM VGA 256 color games to the chunky-pixel
format that is available at that depth. All of the formats you mentioned above
are supported (and more) on the 1200 or any machine that has the AGA chipset.
Do not confuse the 1200 as "a faster 600". They share VERY little in common
with the exception of a similar-style case.
>>Rgardless of the custom ships, it can't handle all the fast color changes the
>>Falcon can...
Get real.
>You have no clue.
You said it.... He also forgot to mention that the 1200 has a RETAIL
price of US$699, and I am SURE you can get it for about US$100 less in many
other places.

>The A1200 can have 1,2,3,4,5,6,7 or 8 bits per pixel.
This is not exactly true. It can do more! :-) All AGA chipset machines have a 16 milion color pallete, can do various scan freqs, and you can turn on and off a mode that gives you "chunky" pixels, just like PC VGA displays. There are also new modes that can be thought of like "super HAM" modes that give you 256,000 simultaneous colors, though due to the speed you don't get the banding that occurs in the ECS & older chips (since you can make larger steps).

>disk up with small text files, so that every data block on the disk was
>occupied.

Be warned: not all drives can read tracks 81 and 82. It's generally
a bad idea to put important data on these tracks; i.e., don't use
this format in practice if you care about your disk. The other method
of increasing disk capacity beyond the standard limit, putting more
sectors in each track, is more reliable.

If you really want to fool with PC/ST disk formats, I recommend you get
a PC program called fdformat. It should be on the usual archives; try
garbo.uwasa.fi, for example. Fdformat lets you do all kinds of tweaked
modes, including all the standard ST ones. It even has a mode to
change the media byte so that disks will look just like ST disks to the
ST. (You can also get 1.7M on a 3.5" HD disk, which is pretty nifty.)

I don't know how fast it formats or copies. That may very well depend
on your particular floppy drive.

But actually, if it is a self-extracting archive, it can still be
looked at by your zip prg, so you can see whats in it before you download.
(I actually prefer self-extracting. That way I know it will extract when I
get it downloaded. I hate having to download something, then have to go
online and download an archiver that can handle it.)

Could someone with the AGA hardware information post the amount of
available bandwidth for the various display modes? Even if there's
no contention in any particular mode, it would indicate what is
the absolute limit at which a blitter, '020, '040 (or even a DSP
rated at 1000 Mips) is able to access video memory.

> Sure beats Yet Another Crippled System, yet another 16-bit memory arch...

The Falcon 030 you mean? The memory system (as people have repeatedly
mentioned) is configured for 32-bit access by the memory controller.
Since 64 bits are fetched in two quick cycles, the 16'bit datalines
keep filling the '030 with data pretty effectively.

As for crippled...since the A4000 has 32-bit data/address lines, it
would seem that it should offer more than 8 bits graphics? The
Falcon 030 may be maligned as a 16-bit machine, but as least it has
16-bit graphics capability.

Parts of the book are written with Wordplus (don't laugh), other parts
MS-Word. I am currently evaluating some of the newer WP packages.

And, btw: it wouldn't make much sense to translate the current edition,
because there's no information abouth the Falcon or MultiTOS in it
(and that -- if it happens -- will need a LOT of time).

>
> The product wouldn't be state-of-the-art Queen's English perhaps, but

A good basis for this would be MiNT, but only if it had TCP/IP added into the kernel and at least process swapping (680[346]0 only). Device drivers for the network devices could then be loaded at boot time just like file systems can be now. TCP/IP wouldn't bloat the kernel much, after all KA9Q is only about 40K as an executable and this includes the clients as well as the protocol layers. Unfortunately something like KA9Q is useless for X as it cannot be used by external programs.

The programming interface for the TCP/IP stuff should be identical to that on BSD hosts so the minimum of porting of code is necessary, the only thing needing to be written from scratch being the X server itself.

What would be really good for machines based upon the 68030 and above (ie the TT, Falcon etc) would be to implement GEM over the top of X. This would allow a fully networked version of GEM. I must admit that you'd still have to have a relatively large amount of memory, ie at the very least 4MB preferably 8MB or more.

If you want to have X, this is the price.

Steve

PS. Eric, now we have memory protection in MiNT on 68030's and above how's about virtual address spaces, ie all processes seems to be at the same address, this would enable easy shared text without needing the program to have been compiled with -mbaserel -mpcrel and would also enable non-blocking forks. Any possiblility of having a word with the people upstairs about this?

2213. WANTED: Genlock

Newsgroup: comp.sys.atari.st
Date: 1993-02-05 12:11:11 UTC
From: EDWR@UNB.CA
Message-ID: <05FEB93.08841593.0054@UNBVM1.CSD.UNB.CA>
Source record: 210740

I am looking for a Genlock for my ST. Does anyone know if JRI still exists, and is producing genlocks ? If so, can anyone suggest a good source. Are there any other products that I should look at? I need this for a project NOW, so any help would be appreciated.

Thank you
Alan

This is total and utter BS. The falcon IS selling, at least here in
holland and probably also in germany! So don't say these things that
are not true.

If you don't want to be objective, don't write to this newsgroup. Go and
post at the amiga group. I like the Falcon, but I'm still interesseted
in other MC680x0 machines, so I like comparisons.

The magazine was ST User. Can't remember which issue but it was probably about November or December '92.

********WRONG!*********

The f stands for floppy (as in 'built-in').
It is the m in STfm that stands for modulator.

|> 16-bit graphics capability.

Ah, but the A4000 can offer 8 bits at 800x600 and 1280x400 (not including
overscan here), not to mention that it can also do those in 256k colors
and animate them without taking a lot of memory.

Well, thinking of things, the Falcon is a nice machine in overall, if
people can use the DSP for games in other things like sounds, that would
be really nice to see. But for applications I see the Amigas a better
offer, not to mention games too (except for the music, which is something
that the Falcon seems to be very good at).

I still believe that the Falcon is somewhat crippled, not matter if you have a fast memory controller, the 68030 still fetches info @ 16bits which is SLOW for it... doubles the time during memory access....

I am using F2C together with GCC and have found this combination very useful.
Both of these compilers are free as you probably know.
I have compiled SPICE version 2G6 with F2C and GCC successfully with no changes
in the source at all. The sources to SPICE is several houndreds of kilobytes.

From: csullogg@cc4.crl.aecl.ca
Message-ID: <5FEB93.10045978@cc4.crl.aecl.ca>
Source record: 210606

Last night I set up the Windows 3.1 screen saver to display a banner message. The message was "CCCCC HHHH CCCCCCCCC" in a 42 point font.

Even at the slowest speed, the 386@40MHz with an ATI card could not scroll the message smoothly. At faster speeds, the message flashed on and off as it scrolled. This so called FAST BOX as some PCs have been called could not perform a simple graphics display smoothly.

Now I know why I have waited for the FALCON since I saw it demonstrated in Toronto last April. Its graphics and sound capabilities, right out of the box, will blow a '386 right out of the water.

The next space left blank for PC enthusiast flames (as they try to explain why the '386 could not do the job)

Stephan, the seller should have provided you the cable as one originally
came with the GCR. If that is not possible now, you can simply use any
external drive floppy cable as they are one in the same.

>Try the pfx-packer that's distributed with lharc, should work with it.

That's the one I tried - pfx 2.1. But it's guiltware (or can I use it if I only compress one program (i.e. nethack) and then throw it away?). There might be a problem with making the compressed nethack binary available for ftp afterwards.

Anyway, as I said, though the compressed binary did not crash, I'm still suspicious about pfx-pack not being able to properly decompress it again.

So, if there are any alternatives at all - please drop me a line (and/or a packer :-)

The 640K conventional memory barrier of DOS is the single most archaic reason that the pc is so difficult to program. OK, before I get toasted, let me say it's the reason that _I_ find it difficult, OK? Sure, memory managers may be used to work around this but it's still a kludge. The relatively "flat" memory architecture of the Atari certainly relieves a lot of unnecessary pain.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^

In fact, this is understating AGA's capabilities. If you choose your palette carefully in HAM8, then you can use ALL 16777216 colours. (This is assuming you had this many pixels on the screen :-).

There is a program going around called AGA Test, which uses the entire 24 bit palette without changing any colour registers.

|> the banding that occurs in the ECS & older chips (since you can make larger
|> steps).

The extra resoloution helps too. You can have HAM8 in 1280*512 (Or more with overscan), and whilst I don't have any of these pictures yet, I have some 640*512 HAM8 pictures, and they look incredible.

2229. ST Hardware for Sale

Newsgroup: comp.sys.atari.st
Date: 1993-02-05 16:05:55 UTC
From: malay@sae.com
Message-ID: <1993Feb5.160555.18815@sae.com>
Source record: 210627

I've got some extra ST stuff for sale (I own an STe too!):

1040STf - stock, excellent condition, brand new internal
drive (Atari authorized replacement part). This
machine looks and acts brand new. $175 (includes S/H)

VideoKey - Hook up an ST without a modulator to a TV - great for
games. $50 (include S/H)

SM124 - Needs some work - comes up, looks great, runs perfect
for a while (until something heats up) and then the
picture gets stretched and jittery. $40 (includes S/H)

I don't have any of the original cartons or manuals, but all
hardware comes complete with original cables.

I always wellcome all clarifications. If the Falcon is finally selling
good. I was getting the info from other Atari people. And yes, I want
to be objective... I consider the Falcon a very good sound machine.

I think also demand objectiveness... which is why I see no point in
saying that the Amiga 1200 has either slower graphics than the Falcon
or a Bad OS.

2231. nethack 3.1 record file bug resolved

Newsgroup: comp.sys.atari.st
Date: 1993-02-05 16:59:40 UTC
From: christof@wowbagger.pc-labor.uni-bremen.de
Message-ID: <1993Feb5.165940.1430@informatik.uni-bremen.de>
Source record: 210615

The bug in nethack's handling of the record file (it would always contain only a single line - arrrgh) has been eliminated and I strongly recommend getting the new version. Old record files (the one-liners) *must be deleted*, they are not compatible with the new binary (because of the bug, the record file contains bad strings). It turned out the bug was in the GNU lib with which our binary was linked (read this, Hannu? :-)

Oh, and the file wizhelp was missing in the first release (no one seems to have noticed, though). This is not needed to actually play the game, just a quick reminder of wizard-mode commands. Nevertheless, it needs to be included, of course.

In addition to that, a TT-only version is ready. This is somewhat shorter than the ST binary (which still runs on a TT as well, of course) due to taking advantage of the TT's advanced hardware capabilities (68030 code).

I'm going to put everything on the server later today. I'll reorganize the structure, so that there will be one archive containing the supplementary files and separate archives for the binaries, so you won't have to download anything you don't need. I'll also make wizhelp available as a single file for some time, for the same reason.

What's more, I'll post the archives to comp.binaries.atari.st on behalf of the multiple requests I recieved.

Thanks again to everyone who responded, commented, etc.!

Christoph

Yes, the Falcon is selling now, all over Europe and the UK. Why isn't it in the US? According to Atari, they're stockpileing enough for their 6 month projection so they don't run out*, they're redesigning the case (thank God,) and finishint MultiTOS. And to address those "But the Falcon doesn't come with MultiTos" whines, it does. The version selling now is not the final release.

* My store has been trying for two months to get 1200's in. Commodore assures us they are "on the way." Unofficial sources say they just ran out. Great marketing plan.

Nice list of resolutions... will the Falcon still need to be rebooted
to change to a different one like the STs did?

And what's this about "Overscan is not accessible from the desktop"?

>out to be 1.6MB/S on an 8-bit ISA bus and 3.2MB/s on 16-bit ISA bus. If I
>remember correctly, EISA bumps the bus speed up to 12MHz (or maybe that is
>MicroChannel) or 16MHz. Even at the 12MHz speed, with a 32-bit bus and a
>5clock memory fetch, that is 10MB/s.

You must not forget that there usually resides 2-3 "high bandwith" devices
on the (E)ISA bus. The most common is HD-controller and VGA card. Additionally
you have serial and parallel ports, floppydisk controller. Most people these
days have a soundblaster and other "multimedia" addons.

I'm not saying you'r wrong, but even if the RAW performance of the bus may
seem high (at least high enough), the net performance may be poor due to
bus arbitration and contention! And, of course this is not uniqe to the
(E)ISA bus. It even applies to the Falcon's bus(es). (Althogh I'm sure
the bus(es) of the falcon performs MUCH better than ANYTHING found in any
PC clone:^)

(Anyone who starts a serious flamewar on this posting
should have their head (or was it humour) checked)!

According to my information the 640x480x65536 mode is only available in
interlace which means it would not even work on a VGA monitor.

cd.amdahl.com!kls30: ? I would beg to differ. A 68030 on a 32-bit architecture machine EASILY toasts my 386/25SX. And, since the falcon does share the same crippling as the sx's, you might expect it to perform about the same...
but then again, the Falcon 030 has _MUCH_ faster native graphics, (taking some of the burden off of the processor) and a far better addressing system than ANY intel based machine in the cloner world to date. My PC does a lot of calculating 16bitx16bit adresses just to break out of the first 640K.

BTW, a stock atari ST performs 148,000 simple register math operations per second, and more floating point operations per second than a 386/16 by a factor of almost two.

WTF ? The guy made a point. The 6502 (sic) was designed in 197x something and
it had surely no provision for virtual memory per se. On the other
hand I do think that the 68000 was developed with VM in mind, but
because of a fault in the microcode (one register wasn't saved during
bus errors (or some such)) VM was not possible till the 68010 (+ added MMU)

>The Mac was released shortly after the 68000, had a 68000 in it, and

>that pretty much puts the argument to rest, now doesn't it?
The Mac and virtual memory ? It does (did) have a memory allocation and
referencing scheme, which I can't quite remember offhand, but that has
nothing to do with VM on the hardware level. Considering anything else,
you have 'virtual memory' everywhere. See how your editor swaps memory
in and out from disks...

Nat!

I know this will be incorrectly interpreted as an "Atari sucks" article
by those with a jaundiced eye, but I have been writing a lot of game
related code for the PC recently, and have discovered that this
long-time criticism of clones is no longer as significant as it once
was. At the risk of being at the center of another massive flame war,
here goes:

You do not have to worry about the 640K limitation for DOS applications
unless you feel it absolutely necessary to support the 286's that
comprise less than 10% of the PC market now. You can have a prefectly
wonderful 32-bit flat memory model on a PC, just like on the Atari.
Not only that, but the 32 bit code is faster than "large model" PC
equivalents.

The technology that makes this possible is a so-called "32-bit
extender." Basically, it does some magic to switch to 386 mode without
clobbering DOS, 386Max, QEMM, or other memory-resident things. So you
switch to 32-bit mode, run your code, and then switch back. Everything's
just dandy. Windows does something like this itself.

This technology is free. In fact it is the basis of the excellent PC
port of GCC (2.2.2) by DJ Delorie. What's even neater is that the
32-bit extender supplied with DJGCC knows about Super VGA cards and
sets up the page table to make the video RAM appear to be an (up to)
1MB contiguous block. This means you can trivially write programs that
use the higher graphics modes, and they're all byte-per-pixel format.
And the assembly language blitting rotuines for video games (should you
be inclined to write them in assembly; you don't have to for something
like pacman) will be even faster in 32-bit mode than they would be in
"real mode" because there's no foolishness with taking several
instructions to do things to "far pointers."

Microsoft and Borland are both working on their own "official" 32-bit
extender pacakges. In fact the MSC 7 package refers to it in the
documentation (even though it hasn't been released). Zortech has had
32-bit compilers and extenders out for a while, and PharLap makes a
32-bit extender that works with Borland and Microsoft executables.
(The latter is expensive, though.)

The bottom line is that if you are willing to blow off 286 support, you're free of such brain-damage. As time goes on, blowing off 286 support will be less and less of an issue. Many PC games already assume you have a 386+ for speed reasons. (After all, 386 motherboards are $150-$175 now, less than complex software pakcages.)

And, to once again start this a-thousand-times-discussed discussion
about falcons data bus and casing, I am posting this :

A person I know (remotely) said that he had received a fax from Atari
saying that the Falcon has been recased, and that there will be a
professional version in october or november. He also quoted the fax
and said something like "32-bit data address buses with instuction and
data caches". So, has anybody heard anything like this? I hope this
will not result in a big confusion, like there was a time ago (with
the data bus).

>scale.

That's a good point (hey, nothing to do with Atari computers but
a good point nonetheless). In the 1960s there were even machines
that could execute several instructions simultaneously. There
was a unit which scanned ahead and determined if an instruction
depended on the result of an instruction which hadn't been executed
yet. If not it was sent to a free "cpu" to be executed. The
system only had to wait when it found a dependency. Hmmm...isn't
this one of the big features of "the next generation" of CPUs?

Actually, the same thing is true of software. Almost all programming
techniques currently in use have been around for 25 years or more.
(The only advances I can think of are in program derivation, but
that field has yet to hit the mainstream.) A few years ago I
went to a talk by Alan Kay and he showed films of the "Sketchpad"
program from the mid-1960s. Even today it's an amazing piece of
work.

>to change to a different one like the STs did?

I believe Bill Rehbock said in a GEnie conference (I'd repost it but I accidentally deleted the file... Grrr) that the Falcon030 doesn't have to be rebooted for a program to change to a new resolution. So, you pick a certain "base" resolution to use for your desktop, say 640x480x16, then any program you run can make a system call to place the computer in some arbitrary new resolution. The application will get full VDI support for the resolution it wants to be in, then can just return the system back to the "base" resolution when it exits. Probably to change the resolution the desktop is running in, you'll need to "reboot" just as with the ST, but if software developers follow the guidelines this shouldn't be a problem -- all Falcon030 programs should run from any resolution and exit back to that resolution, among other things.

>
> And what's this about "Overscan is not accessible from the desktop"?
>

Well I don't know first hand, but that's what John Townsend said. Really, this makes sense because if you have a VGA monitor, you don't actually see the extra edges of the screen, so if you were on the desktop, you might not see the menu bar or icons if they were scrolled off. Just like the resolution thing though, overscan is accessible and fully supported within applications, although I'm not sure how MultiTOS will handle programs which are running in different resolutions.

>Falcon determine this?
>
>--
>Jason Balicki | kodak@mentor.cc.purdue.edu

This really isn't any different than the way the ST can tell if it should boot in color or monochrome. If you have something plugged into the rf modulator out (which the falcon has), then it will run in color. The Falcon, however, has the additional benefit of being able to plug in either a VGA or ST-type monitor (mono or color). It can tell which kind is plugged in by what kind of monitor-adapter is in use. So, if there's a monitor adapter plugged in, it uses that ; if there's no adaptor it uses the RF output.

I'm not 100% certain on the RF modulator details, but essentially this is how it works. If I'm blatantly wrong I'm sure someone who actually has a Falcon can correct me. As far as I know the RF modulator is still a separate output, but it's possible there could be a "TV" adapter block as well.

Many people have been reporting problems with ABC, etc.

If you read about four online magazines back in Atari Explorer and Z*Net,
you'll get a better picture.

I don't know if any of this is true, but the one guy's article was
pretty convincing.

As much as I like the ST, the blitter chip on it is a waste of silicon. It is an afterthought designed for the sole purpose of having something to compare with the AMIGA. I wish ATARI had designed it in from the beginning.

It is much cheaper than buying a 340X0 series graphics board for the PC though.

I'm not sure that including a full 32 bit bus would improve the speed too much since the processor timeing has to be finely tuned with the Video chip. The added overhead of a 32 bit bus might not be a worthwile speed gain. I guess an Atari engineer would have to clarify this matter.

>separate output, but it's possible there could be a "TV" adapter block
>as well.

Well, there's no functional difference between a TV and an SC1224 monitor as far as the Falcon is concerned. The video out port has a pair of lines that are tied to either ground or +5 volts, depending on the type of adapter plugged in. The "VGA" adapter sets it one way, the "Atari monitor" adapter sets it the other way. The original SM124 monochrome detect info is also available on the Atari adapter. Anyway, it defaults to Atari video, and if there's no monochrome detect, then it drops into SC1224 mode, which is pretty much what a TV will cope with.

Note - all the outputs are active all the time. I.e., there's a signal present on the composite out pin, as well as out the RF jack, even when a VGA or monochrome monitor is attached. Not very useful information, I guess, since no display device that would attach to them (RF or composite) would show anything useful... (It was kinda nice running some of the demos on my multisync and my TV concurrently. Just had to make sure not to switch the multisync into VGA mode, the TV *really* didn't like that...)

>there, you are gonna have flickering.

It's really very simple. The Falcon *never* uses interlace on a VGA-style monitor. All the available resolutions (up to 640x480x8 bits) are displayed straight, noninterlaced. On an old-style Atari RGB monitor, composite monitor, or TV, all modes with vertical resolution 400 or greater *must* be interlaced. On an SM124 style monochrome monitor, you get 640x400, period.

The 68010 has the capability to support virtual memory while the 68000 does not I realize that this is of no consequence to the ST for 2 reasons 1. Most TOS's do not allow the use of a 68010 processor and 2. the ST hardware doesn't have an extra socket for the MMU. but the chip is plug in compatable (with the Amig at least) with the 68000. I think if you put tos 206 in your machine, you can plug in a 68010 (That is if ATARI ever got around to removing the move .sr instruction from the roms.

Hi Atari Users,

We provide access to USENET & MAIL via UUCP, now DOS (Ugh!) users can use UUPC or FSUUCP or WAFFLE, MAC Users have similar packages. Therefore my question is;

Is there a package available for the ATARI (ST, TT, etc) which can be used for UUCP connections, using the standard operating system. If there are packages where can they be ftp'ed from.

Many thanks

2262. Re: ctrl-alt-del reset adding utility

Newsgroup: comp.sys.atari.st
Date: 1993-02-06 03:06:32 UTC
From: dsmall@well.sf.ca.us
Message-ID: <C20BAw.5GL@well.sf.ca.us>
Source record: 210501

While on the topic of alt-ctrl-del, you might want to examine the code in the keyboard driver for TOS 2.06 for a "coldstart". The "warmstart" code (e.g., no SHIFT)
does the usual stuff -- looking at resvector and all that. (You are warned that the
jmp (a6) still doesn't work, and, the address is moved. Scan for the return address.)

However, in 2.06, the coldstart is really amazing. As nearly as I can tell -- and I invite
corrections -- a pointer is set up, *to the middle of the ROMs*. Then zeros are rammed into
where that pointer points, incrementing indefinitely. Eventually something gives out and you
bus error; I think the bus error code possibly points at restart.

I've been wondering since before we shipped the SST (call it 1 1/2 years) what this code does.

One theory, since writing into the ROMs will result in an immediate bus error.

Let's say you're using a disk-loaded TOS, which moves down the top of memory pointers,
screen, and whatnot, and has been patched-up for the new addresses. (Not that Atari hasn't
ever done something similar -- I had a 520 that had the first disk loaded TOS). Anyway,
if someone does this to 2.06, I *believe* the effect will be to start zeroing out RAM
beginning in the middle of the ROMs, presumably up through video RAM, until a bus error.
Writing 0's into video RAM would turn it all-white, since a 0 bit is a "white' dot in mono.
(Color is weirder, but at least the color would be consistent, being $FFFF throughout).

On a ROM loaded TOS, you'd bus-error immediately, and the video would probably go dark as
the result of the RESET *instruction* at startup, which causes the 68000/30 to send out a RESET
strobe to the other chips.

Hence, I theorize ... and this is strictly blowin' in the wind ... that for computer shows and
other place, this is the world's quickest test if someone is running TOS 2.06 off disk.

Just 4-finger the machine. If the screen goes white, it's a disk TOS. If it goes black,
it is not.

I'm mentioning this because I found it interesting; I don't understand it (certainly!), and
I wanted to invite comments from people "in the know". Certainly the code is going to do
something spectacular -- writing zeroes in an unrolled loop like that is going to tromp
anything in memory, particularly reset-"resistant" stuff.

2263. Re: Spectre 3.0 & apple file exchange?

Newsgroup: comp.sys.atari.st
Date: 1993-02-06 03:14:30 UTC
From: dsmall@well.sf.ca.us
Message-ID: <C20Bo7.5n6@well.sf.ca.us>
Source record: 210502

The basenote asks about Apple File Exchange on Spectre 3.0.

We and many other people tested AFE under 3.0 and it works just fine. However, I have
personally gotten some mondo weird results from Apple File Exchange, like unwanted text
editing. Heck, I don't know, maybe I didn't read the manual right (for the 50th time).
The tables for the disk drive queue data structure (see the undocumented part of Inside Mac,
not in print and non-existent) (*grin*) are set up properly for AFE to see the Atari floppy
drives as 400/800K "SWIM" drives, capable of either MFM (IBM-Atari) or GCR (Apple old)
format.

I personally vastly prefer programs like DOS Mounter or Access PC, both of which work just fine
under 3.0 (how do you think we knew when we got the tables right?) to transfer data in and out
of the Mac. They don't screw with binary data when I don't want it altered; they'll do the
needed cr/lf conversion if I ask nicely, and so forth.

I don't know ProDOS well. That was a long time ago. I can't give you any info on whether
Spectre will deal with a ProDOS disk. I believe at least the directory structure is different,
and I don't know if AFE will tolerate that. I don't even know if 3.5" ProDOS disks are MFM or GCR.

It might be easiest to lay hands on an Apple II and spend some time with an automatic modem
program like zmodem (I prefer it) to convert data, although that depends a lot on what you got.

2265. Re: 030 sync cycles (...)

Newsgroup: comp.sys.atari.st
Date: 1993-02-06 03:32:45 UTC
From: dsmall@well.sf.ca.us
Message-ID: <C20CIL.5zA@well.sf.ca.us>
Source record: 210504

The basenote talks about Falcon030 wait-states on the 16/32 bit bus. I'm trying to save
net bandwidth by summarizing.

I recall reading online that the early Falcons had additional wait states added to them
as Atari was getting the hardware solid. Certainly the version 4 Falcon is far quicker than
the version 2 Falcon, I have personal experience.

I am a bit concerned about memory contention. Now, given that Quick Index is not the best
benchmarker possible, it does have a useful benchmark in CPU-Memory in that it does tell you
how well the CPU is talking to RAM.

In the low resolution modes (say, ST Low Res emulation), the Falcon030 scored 60% of a TT
according to Q-Index. However, when kicked up into high-bandwidth modes, such as VGA,
the Falcon030 scored 40% of a TT in CPU-Memory. It seems to me that probably the video chips
are wait-stating the CPU because they have to grab so very much extra RAM in high res.
All of this has been discussed online elsewhere.

I enjoy the high-res VGA'ish Falcon030 modes, and hope the CPU bandwidth isn't too bad of a
problem for the 16 Mhz 68030. With the onboard twin 256 byte caches (which CPU-Memory overrides)
perhaps this will prove to be the case; the 4K twin caches of the 68040 would be nice indeed.

I wanted to interject this for people who did not know.

Message-ID: <C20D35.67u@well.sf.ca.us>
Source record: 210506

re: The Compo 486-thing for the Falcon.

The referenced note says that Dave Small is working on a Mac Emulator for it.

I know Dave pretty well, and believe me, this is the very, very first he has heard
of all of this.

Please consider this rumour absolutely, positively quashed. As Picard would put it,
"make it not so".

I have *nothing* against Compo - CompoScript is good stuff, for instance -- but I
don't want to see them in the position of having to deal with rumours like this.

[Mind you, I can't, and wouldn't, do anything about somebody popping a GCR into a
Falcon motherboard. That's cool, as long as they watch the latch timing -- email me
for more. But it would be no different than someone getting a GCR for a 1985 520 ST.]

I'd appreciate it, as a personal favor, if Steve Wells can back-spread the correction
to the rumour. This just isn't happening, folks.

Other things are.

2269. Re: Joppa FAX (Re: Atari ST and FAX)

Newsgroup: comp.sys.atari.st
Date: 1993-02-06 04:09:22 UTC
From: dsmall@well.sf.ca.us
Message-ID: <C20E7M.6xs@well.sf.ca.us>
Source record: 210508

The referenced note talks about JoppaFAX.

To the best of my knowledge, the author is Charles Smeton, who is well known in the Atari
community. I have been told repeatedly that one possibility for the new distributor of the
FAX software he writes is Toad Computers, which is reasonably local to him. Toad is at
(410) 544-6943, if my memory isn't failing; they have an 800 number you could find at
800-555-1212.

Again, this is what I have been told, not by Charles.

How do you contact this board? I tried the number in one of their manuels
once, but it did not seem to work. Do you know a number that works. Do you
know their baaud rate?

Hiya, folks. I wanted to let you know I'm back to The Well and "I'm baaaack".

There have been some complaints about Gadgets (and sort of, about me) not being
available. I plead guilty, but extenuating circumstances. I am certainly not as
available online or by phone/fax as I was two years ago, and there are reasons.

First off, we're trying to get Spectre 3.1 out the door. I spent time in Oregon last
December getting this tuned up (we had DMA troubles with the TT). 3.1 now understands
TT SCSI hard disks, and can handle the AHDI/HDX 3 and above "XGM" partition scheme, which
was causing users problems. You can concert partitions on SCSI drives to HFS or MFS, just
as with ACSI, and no problems. (Working this into XGM cost an extra couple of days, not fun.)

As a lot of you know, 1992 was not much fun for the Smalls in general, not just Gadgets by them.
Eric, a 10 year old, was hit by a car and broke his upper leg, which is one of those bones
you don't want to break. The bone also tore up his thigh muscles. He had to have a steel
rod put into his thigh to hold the multiple pieces together; it took the surgeon an extra
hour to line them up. (Gee, that'll be a fun thing to read after dinner). This happened in
May '92. He attended graduation in a 4-legged "walker".

We shut down Gadgets completely over summer 1992. I mean, nobody, but nobody got answered on
anything. The reason was we were working with Eric on physical therapy; we didn't want him to
have a short or weak leg the rest of his life. My wife begged off on PT; she had been through
it twice with knee surgery and knew how much it hurt. So I got to do it. I also got to sleep
around Eric when he'd wake up with muscle spasms, and they hurt quite badly. This went on
all summer, and the closest analogy is a new baby in the house that's real fussy -- every
2 hours.

It turned out well. Eric calls himself "The Terminator" now and points out that bullets
would bounce off his steel leg. (He gets it out in a month or so, oh joy.) He went back to
school in September with no walker, bouncing around, rough-housing with the kids, running up
and down the stairs. It is incredible how fast 10 year olds can heal.

Innn the meantime, some folks that wanted to get ahold of us were rather peeved. We made up
a FAX sheet and sent it out in general (ST-Report quoted it) to our dealers, explaining what
had happened. We even scanned in the X-rays of Eric's leg, which are real graphic. (Definitely
worse than the start of "Basic Instinct"). And we discovered we were 4 months behind in FAXes
and telecalls and so forth, and our input buffer was getting swamped.

Our normal input buffer, "Barb", is now in Jamaica enjoying running a scuba diving biz. We're
looking for someone else. Sandy was taken away 100% by the need to straighten out our taxes,
which had glitched (we filed for extension, then Eric happened -- kaboom). We're basically
understaffed at this point. (Anyone out there want to handle phone and FAX traffic? Drop me
a line...)

The input is pretty overwhelming. People set autodialers to work on us, so the minute I
complete a call and put the receiver down, the phone rings. No hesitation. The FAX is just
unreal. I'm positive we have lost FAXes in the overall overload.

We've been trying to find some help, and with all the aerospace layoffs in Denver, maybe
we will succeed. I've talked with 4 people so far that did not feel right to me; a telephone
person is your whole contact with your customer. You don't want an engineering type doing it.
In the meantime, we answer the phone and ship to dealers when we can, particularly when Sandy
is sick of taxes or I'm wasted on Spectre 3.1. (The recent, most embarrassing bug was to find
out the hard disk write command was changed into a read accidentally; this is surprisingly hard
to discovrer after the avalanche crash it caused.)

My attitude is that I would rather make X thousand customers happy than one person happy,
by *not* answering the phone and wrapping up 3.1, getting it through Beta, and OUT, so TT
users can start using SCSI drives. (3.1 does not (yet) allow generic SCSI,

that is another
issue; we are "special-casing" disk I/O.) 3.1 also has some long-wanted bug fixes, like the
Mega-STe with less than 4 mb RAM fix, and the > 4 meg fix for TT's, but I am having a lot of
fun with big memory in general and the MMU; I have to provide a secure ST RAM disk I/O and
screen buffer, and the *combinations* are giving me flak. (The TT, for instance, has that
big screen monitor which uses up so much more RAM than the ST 32K... I have to allow for it
in ST RAM).

3.1 is essentially ready for Beta test once I get done wiring up the Mac-required device table
stuff ("Gee, is a hard drive ejectable?"), and is headed there, probably on GEnie to begin with
but that is not a restriction to there. I *definitely* want to test out one thing at a time so
I don't get combination errors; big memory combos in particular have WEIRD bugs. For instance,
Mac programs often compress the heap by requesting 8 meg of memory. Request fails, but the
heap compresses. Well, with a TT and GeSoft board, we have 12 megs (or with SST), so... the
request works. WHAM!

The Mac is also "24-bit dirty", meaning it uses the upper 8 bits (like older GFA Basic) for
flags, meaning an MMU has to watch it to keep it from crashing. This is real fun when people
are promising to put 68EC030 chips into the ST, where there IS NO MMU, and where I don't know
a way to lock all 256 "groups" of 16 meg ST-size pages into one. The manufacturers say it is no
problem to run Spectre; I have absolutely no idea how it could work with 3.1. We have long
put out an advisory on this, but it is, shall we say, in the interests of an EC030 board maker
to contradict us. As for patching our code to kill caches (mentioned), Spectre is real touchy
about being patched, on purpose, because of the Dr. Typo dweeb that made a pirate version -- and
wiped out the boot sector of most machines it ran on. (He was 2 bytes off on a patch, and
fell into disk write code with D0 = 0 = absolute sector # = partition sector). This totally
blew away the hard disk for most folk.

So. We know we are too hard to get ahold of; I presently have 130 messages in my email buffer

here on the Well. Yup, that's truly scary, especially with the "bounce percentage" I get of
replies of fail. Oh, well. There are hundreds more on GEnie and so forth. But 3.1 is pretty well
done, and it was a lot of work. [We are debating putting in Sparrow...oopps.. Falcon support
for IDE and Sparrow SCSI, which is TOTALLY different than TT SCSI, beware!, but I'd like a
seperate revision for that. The IDE and SpSCSI code seems straightforward.]

We have absolutely, definitely stopped saying "No" to a Color Mac II'-style emulator.
If you don't know, it's been done for the Amiga, Jim Drew & Co., called Emplant, and is
very, very impressive; we've talked.

I expect that when we finally find the right frontend person (I just hate to call people buffers)
that things will ease up, and we can all get back to our proper jobs. We did manage to ship a
whole bunch of SST's in the one year it's been out, and MegaTalk is out as well; both of those
involved extensive coding and writing of manuals.]

I'll post up here (or someone will beat me to it, no worries) when 3.1 is thru beta and solid.
I don't want to high-speed timing screw up SCSI drives, and some do it, believe me; we're trying
to make the code Mhz independent so all them 150 Mhz accelerators will work. (grin)

Okay, back to discussing the real issues of the day: Whether a PC is a better buy than a
Falcon -- surely the most apples to oranges question I've seen.

Oh, yes. We finally whacked through the Sys 7 thingo that caused so much trouble. But that's
news for another note.

Hang in there, folks.

At the end of 1992, at midnight, we re-formatted a disk labelled "1992". That is our comment
on the whole blasted year. Hopefully 1993 will be an improvement; nice and dull would be GREAT!

-- thanks, Dave Small / Gadgets by Small, Inc. / Bottlewasher, programmer, VP, all that stuff

p.s. It's late, and I don't remember how this editor works. Forgive me the typos.

2273. Trackste Doc for all those that got it from a.a (was stm editor wanted)

Newsgroup: comp.sys.atari.st
Date: 1993-02-06 07:13:08 UTC

In <1993Feb5.112250.5808@cs.ruu.nl>, Jeroen Visscher writes:
>Does anyone know if there exists a better
>Soundtracker module editor than trakst[e].prg ?
>Because this program looks very nice but it is
>almost impossible to use it as an editor.
>There are a lot of nice modules so there has to
>be a program with which these can be made.
>I would like to make my own modules instead of
>listening only.

Have you got a registered version? or just the one off a.a?

Someone renamed the copy that is on a.a to Trackste, and left out
the authors doc. I mailed the doc to Jeff Weiner, so it should
be with it now. The actual name of the program is "Esion".

I've seen no better for the STE than it, the rest tend to crash very
easily and they are about the same anyway.

here is that doc for all those that don't have it, I especially like
his disclaimer on the end of it! :-)

Ålesund, the 5th of April, 1991

After having listened to the divine sounds of 'The Ultimate Musical
Experience', you'll probably be wondering how and with what software
these songs have been conceived. To be frank, writing such songs will
need the skill of a true artist, but at least the software is right here
at your fingertips, well, in your drive, to be precise.

Esion is a program for writing music using samples of real-life
instruments. With four separate channels, two in your left speaker and
two in the right, these samples can easily be matched in to form genuine
music of a previously unheard quality. Esion has been written to take
your STe's sonical capabilities to the absolute limit.

Writing Esion has taken and is taking rather a lot of at least my spare
time, which at least partly should have been spent reading for my exams.
Getting a job without an education is tough luck these days, and so far
Esion has not brought us a single dime. We plan to continue to develop
Esion, but unless we start earning some money on it, we are forced to
abandon Esion as a failed project. If you want us to continue working on
Esion and software of high quality in general, please show your support.
Thank you.

A SHORT INTRODUCTION TO THE USAGE OF ESION

The notes which are valid for Esion range from C-1 to B-3, three octaves. Two octaves are accessible from the keyboard at a time. The other two octaves can be accessed when pressing [TAB]. Pressing [TAB] one more time will make the first two octaves accessible again. The notes are laid out over the keyboard as on a piano.

When EDIT is off, no changes can be made to the patterns. Pressing a key will sound the respective note, but no note is inserted in the patterns. When EDIT is on the note will be inserted, and all four channels will sound.

A tune is built up on positions. A position specifies a pattern, e.g. position 0 specifies pattern 0. When the position is set to 0, pattern 0 will be played. When the end of the pattern is reached, the position counter will be increased to 1. If position 1 also specifies pattern 0, pattern 0 will be played again. This will continue until the position counter reaches 'length'. The position counter will then be loaded with the value specified by 'restart'.

Use shift + sideways arrowkeys to view the different patterns.

A pattern is divided in four tracks, which in their turn are divided in 64 notes. A note looks like this:

```
--- 0000
| | +-- Command field
| +---- Sample number
+------- Note
```

A typical note could look like this:

```
C-2 1000
```

This implies that a C-2 should be played with sample number 1. No command is specified.

```
C#314C20
```

This will order Esion to play a #C3 with sample #14. A command is also specified. Let's have a closer look at the commands. The command field is built up like this:

```
C 20
| ++-- Command parameter
+----- Command
```

The command here is 'C' and the parameter is '20'. The command 'C' means that the volume should be set to, in this case, 20.

I'll list some of the commands available:

```
1 - PORTAMENTO UP
------------------------------------------------------------------------
1XX = slide note up (speed=xx)
```

Will slide the note xx steps upwards per vertical blank.

2 - PORTAMENTO DOWN

2XX = slide note down (speed=xx)

Will slide the note xx steps downwards per vertical blank.

4 - VIBRATO

4XY = vibrato note (x=speed, u=size)

Will vibrate the note, where x specifies the speed of the vibrato and y is the size of the vibrato. Specifying 400 will continue the vibrato.

A - SLIDE VOLUME

AXY = slide volume (+x/-y)

Slides the volume with speed x steps upwards and speed y steps downwards per vertical blank.

B - POSITION JUMP

BXX = jump to pattern xx

Will exit the present pattern immediately and set the position counter to xx.

C - SET VOLUME

CXX = set volume to xx

Will set the volume of that channel to xx.

D - PATTERN BREAK

D00 - next pattern

Will exit the current pattern and jump directly to the next pattern.

F - SET SPEED

FXX = set speed to xx

Will change the speed at which the patterns are played to xx. xx indicates the vertical blanks between each new note. The smallest value allowed is 1, which suggests that a new note is played every vertical blank.

The default speed is 6.

This small documentation is in no way full, there simply are no better docs at present. But to make it a bit easier for you, I've included a finished module with which you can experiment.

For those who have been using the infamous TCB tracker, we have added
the ability to load TCB tracker modules.

We hope you like Esion. If enough interest is shown we hope to include
the following features:

- AVR sample loading/saving
- Midi support
- TT support
- sample editor
- powerful cut/paste functions
- YM2149 (PSG) sound chip support
- 25kHz
- 8 voices
- Monochrome support?

But you really shouldn't count on us getting it done ;^)

The ESION XLI tracker is in no way finished. You'll probably come across
lots of bugs etc. when using it. Esion is under continual development
and may not even be finished as you read this. Still, you can get hold
of the latest version of Esion by registering by the author. You will
then receive the latest version of ESION XLII together with documenta-
tion, replay routines for ST/E for incorporation in your very own
programs and three disks full of high quality samples. The registration
fee is a measly 20 GB pounds or equivalent.

At the moment we are looking for distributors, so ESION XLII may very
well appear at the commercial market. If you are interested in distri-
buting the tracker for us or need music or sfx for a game, do contact
us!

Actually the "Put the Gem Back" puzzle can be solved in a couple of ways...

The "correct" solution involves taking the Gem upstairs and dropping it into the pit so it ends up back behind the gate where it was in the first place... (you could probably say that just dropping it doesn't constitute "throwing"...)

You can also just jump into the pit and end up behind the gate yourself... there's a lever on the other side of the gate, where you end up under the pit, that will let you open the gate from that side... (umm.. maybe it's a button... whatever..)

Along the same lines though, just past that part is the fireball cannon gauntlet... it's hard to get through there without tossing objects onto the floorplates unless you're VERY quick... but it can be done.

I still haven't had time to start up a new game and try some of these ideas out... it would be fun though...!

I was under the impression that SEA's still complied to the normal
archive format and could be listed/extracted normally with the archiver
program if you desire to rather than just running it to extract itself.

Mattias Hembruch mentioned Planetary Defense...

Yes indeed..!! That was one of my favorite games on the 800..

It had a very unique approach, with the orbiting platform and
targeting... took a little bit of practice to get used to it, but
once learned, it was an addictive game..

Another masterpiece by Tom Hudson...!

> Might be very nice in TT high though. :)

As suggested, reading the english docco (brief though it may be yet) that comes with it would probably have solved your problems in a few minutes.

Changing to the english resource file is an utter doddle... the only suggestion I would make (oi! wolfgang!) to the author is that he check the machine's country ID and load the appropriate resource file...

As for getting 24x80, well, you _really_ must have been out of it - the option to select the scrollbars/windowmenu etc would probably have bitten your mouse if it had been any more obvious...

*> It is a bit slow, but that can be fixed with a screen
*> accelerator like Warp9 or NVDI.

Anything as picky and legal as CoNNect will be slow without a screen accelerator - if you're not using one already, then there's something _seriously_ wrong with your setup!

I take it is still feasible to make a free-will project out of it then - if enough volunteered to do it free (well, a free finalized book would be nice). If SYBEX would back the publishing, we could do the translation. Thei it would not be 75000DM, but reather a couple of thousand for correction reading.

Special Edition Friday Night Conference
GEnie ST RoundTable

Dateline Atari! with Bob Brodie
Host - Lou Rocha

February 5, 1993

<[Lou] ST.LOU> Welcome to another session of Dateline Atari! with
Bob Brodie. Let me begin by thanking Bob and his colleagues at
Atari (Bill Rehbock, John Towns, Greg LaBrec, Dan McNamee) for
their online support of GEnie members. Their participation has
been most helpful to all and has certainly raised the excitement
level in the ST Round Table.

Since we last met Bob, there has been increasing information about
new software to be bundled with the Falcon030. We have also heard
about MultiTOS, SpeedoGDOS and that great new integrated
application, Atari Works <originally named ST Sutra, then
Concierge>.

Bob, I have really been looking forward to tonight's RTC. I think
the transcript for this one may set a new record for downloads
surpassing even your last meeting with us. So let's get this show
on the road with your opening comments. GA

<BOB-BRODIE> I'd like to welcome every one to our February
installment of Dateline Atari! I hope that all of you are
enjoying these conferences as much as I am. I'm pleased with the
opportunity to interact with each of you, and share with you all
the latest events in the Atari Community.

Tonight, I want to start things off by discussing the current status of the Atari Falcon030, and then we'll talk about our integrated package, Atari Works.

At our last session of Dateline Atari, I told you about the delay in the shipments of the Atari Falcon030 to North America. The reason for the delay was unacceptable performance from one of the contracted manufacturers that Atari is dealing with. At that time, I also indicated to you that we would be bringing on another firm to supply us with Atari Falcon030s, as well as attempting to resolve the quality concerns with the units at the original manufacturing site. I'm pleased to report that the new factory has come on-line in the speedy fashion that we anticipated that they would. We have seen the first runs off of that line, and the quality is dramatically better than the original units. A recent run tested out at less an 0.5% defect rate, which is thrilling news to me! This means that our projections last month that Falcons would be available in North America in March is right on target! We _WILL_ to have the machines in stock in March!!

The added plus of this delay is that we have completed MultiTOS, and all of the machines in North America will ship with MultiTOS! There will be no customers that will purchase Atari Falcon030s that will have to be "retrofitted" with MultiTOS! While we are still debating internally how we want to distribute MultiTOS to the established user base, I'm very pleased that it is _done_. In addition to the inclusion of MultiTOS, we will be finalizing Atari Works as well, and hope to have that available as well to ship with each Atari Falcon030, along with SpeedoGDOS.

Let's talk about Atari Works at this point, and try to give you a glimpse of what is coming with that product. Atari Works is a fully integrated word processor, database, and spreadsheet. It's intended to provide the average user just about anything that they might require in a package to be used in either the home, or for a small business/home office scenario. Most of our energies with Atari Works have been focused on the word processor component of Works, as we believe that word processing is still the most common usage for home users. The Atari Works word processor offers multiple documents, full cut and paste between documents and the other portions of Works, easy set up of justification (left, right, center, or proportional), and importing of GEM metafile images. Atari Works has full SpeedoGDOS support, which means multiple scalable outline fonts with multiple sizes, and your usual bold, italics, underline, outline, superscript, subscript, footnotes, and headers. Works uses the Proximity dictionary system, and updated version of the system that was used with Word Up and Word Flair II. There is also a thesaurus included with Works. Works has full search and replace capabilities, again easily activated by drop down menus.

One of the features that I really enjoy in using Atari Works is the exceptionally easy mail merge capabilities with Atari Works database module. It's always been something of a pain for me to have to mail merge. It seemed to me that there was never really a system that felt very intuitive to me for mail merging. With Works, there is a drop down menu called "Begin Merge" that allows you to begin the process. It's TERRIFIC!!! On the editing side of the coin, Works allows you to transpose letters that just need to be flip-flopped with a Control-T command. Its also "intelligent" about it's editing, in that if you begin moving around text, Works will recognize the need for additional spaces and automatically insert the spaces for you. There are also commands that will allow you to do a number of different text commands, like setting areas to all caps, or all lower case, and other text handling.

The word processor of Atari Works also supports the importation of standard ASCII text, the Microsoft Rich Text Format (RTF) files. This is an increasingly popular format used with PC and Mac word processors, like Microsoft Word. The logical extension of that is that your documents at work can be saved out as .RTF files, and readily brought into Atari Works with the formatting fully intact!!

The database portion of Atari Works will import .DBF files, tab delimited ASCII, and comma delimited ASCII. The Atari Works database is a breeze to set up and work with, too! If you start a new database file, the system begins prompting you for field names, until you tell it you're done. Once the fields are entered, you simply click on the fields and hold down the mouse button while you drag the field to the desired size! Simple, eh? You can add additional fields later by simply clicking on the database form with your mouse. Fields are moved about the page simply by clicking and dragging them. You can display the records in a form fashion, or in a list fashion that looks very spreadsheet-ish to me. :) Since everything in Atari Works is fully GEM compliant, you can also highlight portions of the database records, and save out the area as a GEM metafile and drop it into your document! Of course, this also applies to the spreadsheet as well. That makes displaying graphs and tables as part of your document easier than it's ever been before.

Bill Rehbock, the product manager for Atari Works, tells me that the database portion of Works will feel very familiar to anyone that has ever used a database on a Mac. My sentiment was that I didn't find an overpowering need to run to the docs just to get things going, the database has a very comfortable "feel" to it. I'm not generally comfortable with ANY database, so I have great confidence that most of you will really enjoy the database portion of Atari Works.

The spreadsheet portion of Atari Works is Excel command compatible. Our intention with the spreadsheet is not to compete

against stand alone products like LDW Power, but to provide a good, basic speadsheet for users to be able to chart, graph, and track their finances. We have some portions of our business presently tracking their finances under the spreadsheet of Atari Works.

I could go on a little bit longer about the spreadsheet, but I think I've gone on about as long as I dare on this opening. Let's see what kind of questions are out there, Lou!

2285. Looking for PD or Used Atari ST Sequencer and/or SysEx Tools

Newsgroup: comp.sys.atari.st
Date: 1993-02-06 23:54:39 UTC
From: bob@atlantis.CS.ORST.EDU
Message-ID: <1l1j3vINN8r1@leela.CS.ORST.EDU>
Source record: 210524

Hello there. I have just recently had the good fortune to rescue
an Atari 520ST from gathering dust in a friend's garage. This system
has 512K, a single-sided external floppy, and was updated to TOS in ROM
(I don't know what version.) Also has a mono monitor. I would like
to incorporate this into my MIDI setup, but don't have too much in
the way of financial resources right now. I am looking for either a
PD sequencer (FTP site somehwere?) or something used for a low price.
Or, it also would be handy to just use the ST as a SYSEX dump recorder
for the sequencer I am using now (an ESQ-1). Any info would be
appreciated.

There is a PD sequencer called EKSEQ. You should be able to download it
from atari.archive.umich.edu.
I looked at it once, but I don't have a keyboard, so I couldn't really try
it out.

2288. Falcon Monitor Detect

Newsgroup: comp.sys.atari.st
Date: 1993-02-07 05:22:51 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <C22CA3.5BC@sdf.lonestar.org>
Source record: 210527

Everyone is talking about how the Falcon can detect a monitor, and I noticed there are 2 pins used called M0 and M1 on the Falcon. And since I have heard that it DOES know what monitor you are using and I've heard that you need an adaptor for any monitor you use, i have come to a conclusion.

My conclusion is that M0 and M1 combine to make a 2 bit word that determines the monitor type and that the adaptor simply makes one or both of these pins "high" to set the monitor type. My guess is that if they are both low, then the machine assumes its using the RF port and assumes a TV. The other pins likely detect VGA monitor capability and possibly detect the Genlock capability on the other pin, or maybe its a multisync detect.

Anyway, it seems to be able to do it through the specialized use of the video port.

2289. Does anyone have info. on the U.S. Compo products distributor?

Newsgroup: comp.sys.atari.st
Date: 1993-02-07 06:45:21 UTC
From: millerm@CS.ColoState.EDU
Message-ID: <Feb07.064521.41866@yuma.ACNS.ColoState.EDU>

I am considering the purchase of an Abaton 24/96 external fax modem. I was wondering if anyone knew anything about this partiucular modem. I have no experience with fax modems. I am interested in getting a fax system working on my atari st and would like to know if this modem is suitable. Does fax software have to be compatible with a particular modem or will any fax modem work with any fax software. Also, what other modems do you think I should consider? I would also like pricing and suppliers addresses/ phone numbers if you have them. Any help would be appreciated. Thanks

2291. Program Registration Keys (How do I incorporate this?)

Newsgroup: comp.sys.atari.st
Date: 1993-02-07 10:36:38 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.YUa&eI3HbgQ@elfhaven.ersys.edmonton.ab.ca>
Source record: 210530
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

There is an interesting method of releasing Shareware programs that seems to be growing in popularity. The program is released with all functions intact, but key functions locked out unless the user enters a "key". CoNnect is a program that does this, as does MasterCache.

How is this done, though? I would like to use this method of releasing programs (faster for the user, cheaper for me).

How do I generate the key (based on the name of the user)?

Lastly, I would like to know what people think of this method of releasing software (which is why I crossposted to comp.sys.atari.st). Do you like it?

From: Hans-Christian_Scherzer@hb2.maus.de
Message-ID: <A13685@HB2.maus.de>
Source record: 210531

hiya, friends,
just be honest about it: did you ever consider the possibility that
YOUR COMPUTER might provide elements of subconscious tension!?
Weird, twisted anxieties that could force a human being having bought
the Falcon030 to become ... you name it!
No reason to suffer. Things are bad enough without the bugs on your
software (running on the Falcon030) adding even more misery to the
troubles of the world.
Remember the years of '85, when an astonishing machine appeared which
was attributed 'power without the price': what did you get these days?
512k RAM, TOS from floppy and after booting even less memory, a BASIC
which merited not even this name...
So let's have some patience, wait for better days of adapted software
and hope that the bureau of finance will reduce the tax according to
the price without the power.
Christian

[...]

Has anyone had any trouble running NetHack 3.1 on an ordinary ST? I downloaded and decompressed it to my hard disk last week, and booted without any accessories or AUTO programs in order to give NetHack most of my 2MB memory.

When I double-click on the program to run it, the program loads, there is a short pause, then I'm dumped back to the desktop. Has anyone else got it to work?

I have TOS 1.4, if that has any bearing on the problem.

Wrong conclusion. SFII has been out for a while, and has yet to sell a single Amiga. BTW, interesting that it's $70 on SNES, and less than $40 on the Amiga...

I'd go a lot farther: the 640 K conventional memory limit is a consequence of
the 64 K bank size assumed 1n the Intel architecture. And half (or more) of
the weirdness of Windows programming is in response to 64 K limits on various
things.

Hi,
>i search a good tcpip package for atari st to establish a slip line to
>my computer on the internet via modem.
the only tcp/ip packages I know are ka9q and sticp (which is an enhanced
version of ka9q with scc support). I tried both and put ka9q into the
dustbin.

sticp can be found within the atari/telecom directory of a.a. The files are
sticp.lzh (binaries & some config file examples) and sticpsrc.lzh (sources,
docs and even more config file examples)...

/s/ Udo
PS: I don't think that ka9q or sticp are GOOD tcp/ip packages but unfortunately
there are no better ones :-(

all you need is the software, a normal modem (the faster the better) and
someone who lets you in. Works perfectly here in good(really?) old Germany...
Software? sticp..

There is one excellent vector drawing program for the ST. It is called Avant Vector from CodeHead Software. It will convert bitmap picture to vector, create vector drawing with it, and save/load vector picture using .GEM/3, .EPS and other format, too.

It is available at ATY COMPUTER in Oakland, California. There number is 510-482-3775.

Has anyone used or installed the T_64 Tos2.06 expansion board.
I need any comments (good and bad) as I am about to purchase one.
Here in Australia the unit cost is $229.00, which seems a little
steep. What do you actually get for that price.

Any help would be appreciated.

This is one of the reasons that whatever system I buy WILL HAVE a CD-ROM
in it. Hmm, guess there's no Falcon version of Sherlock Holmes, Consulting
Detective, eh? Darn.

I hope you're not suggesting that people with 1M will be able to run this
when it's compressed...

You'll need at least 2M of RAM for a version with all the options left
in (the binary I built yesterday is about 1019k or so). You'll probably
need 4M for a pfxpak'd version (since it'll have to load the compressed
file, then unpack it to another region of memory).

Does anyone have any suggestions on getting the size down to something
1M users can deal with?

Well, I think you're out of luck... Read the djpeg docs!

Rumour has it that GEM-view 2.?? will save as GIF or TARGA, _if_ you
register it (it's shareware after all).

djpeg is definitely the only free way to decompress a JPEG file.

Are you using a TT with lots of RAM? I've found that GNU C eats up all
available memory, making it a bit difficult to run anything else (and
yes, I've fixed the stack size to be "what it needs" instead of "all
free RAM")...

MiNT with tcsh running in a TOSWIN window, and NetHack running in another
TOSWIN window is definitely a good thing. Add MultiTOS with STalker or
CoNect running, and you're starting to wish you had a faster computer...

:-)

It'd be much nicer on a 20M TT...

O.K. folks,

I last week uploaded several screen savers for extendo-saver in Warp 9.
I am about to u/l another screen saver for it. It is from the Codeheads
and is a mendelbot screensaver and works in all ST resolutions and the TT
color resolutions.

Files: SAVERS12.lzh
MANDALA.LZH (NEW THIS WEEK).

If it isn't up by the end of today, Sunday, I will try to u/l it
tomorrow. The lines have been really busy.

Special Edition Friday Night Conference
GEnie ST RoundTable

Dateline Atari! with Bob Brodie
Host - Lou Rocha

February 5, 1993

<[Lou] ST.LOU> Welcome to another session of Dateline Atari! with Bob Brodie. Let me begin by thanking Bob and his colleagues at Atari (Bill Rehbock, John Towns, Greg LaBrec, Dan McNamee) for their online support of GEnie members. Their participation has been most helpful to all and has certainly raised the excitement level in the ST Round Table.

Since we last met Bob, there has been increasing information about new software to be bundled with the Falcon030. We have also heard about MultiTOS, SpeedoGDOS and that great new integrated application, Atari Works <originally named ST Sutra, then Concierge>.

Bob, I have really been looking forward to tonight's RTC. I think the transcript for this one may set a new record for downloads surpassing even your last meeting with us. So let's get this show on the road with your opening comments. GA

<BOB-BRODIE> I'd like to welcome every one to our February installment of Dateline Atari! I hope that all of you are enjoying these conferences as much as I am. I'm pleased with the opportunity to interact with each of you, and share with you all the latest events in the Atari Community.

Tonight, I want to start things off by discussing the current status of the Atari Falcon030, and then we'll talk about our integrated package, Atari Works.

At our last session of Dateline Atari, I told you about the delay in the shipments of the Atari Falcon030 to North America. The reason for the delay was unacceptable performance from one of the contracted manufacturers that Atari is dealing with. At that time, I also indicated to you that we would be bringing on another firm to supply us with Atari Falcon030s, as well as attempting to resolve the quality concerns with the units at the original manufacturing site. I'm pleased to report that the new factory has come on-line in the speedy fashion that we anticipated that they would. We have seen the first runs off of that line, and the quality is dramatically better than the original units. A recent run tested out at less an 0.5% defect rate, which is thrilling news to me! This means that our projections last month that Falcons would be available in North America in March is right on target! We _WILL_ to have the machines in stock in March!!

The added plus of this delay is that we have completed MultiTOS, and all of the machines in North America will ship with MultiTOS! There will be no customers that will purchase Atari Falcon030s that will have to be "retrofitted" with MultiTOS! While we are still debating internally how we want to distribute MultiTOS to the established user base, I'm very pleased that it is _done_. In addition to the inclusion of MultiTOS, we will be finalizing Atari Works as well, and hope to have that available as well to ship with each Atari Falcon030, along with SpeedoGDOS.

Let's talk about Atari Works at this point, and try to give you a glimpse of what is coming with that product. Atari Works is a fully integrated word processor, database, and spreadsheet. It's intended to provide the average user just about anything that they might require in a package to be used in either the home, or for a small business/home office scenario. Most of our energies with Atari Works have been focused on the word processor component of Works, as we believe that word processing is still the most common usage for home users. The Atari Works word processor offers multiple documents, full cut and paste between documents and the other portions of Works, easy set up of justification (left, right, center, or proportional), and importing of GEM metafile images. Atari Works has full SpeedoGDOS support, which means multiple scalable outline fonts with multiple sizes, and your usual bold, italics, underline, outline, superscript, subscript, footnotes, and headers. Works uses the Proximity dictionary system, and updated version of the system that was used with Word Up and Word Flair II. There is also a thesaurus included with Works. Works has full search and replace capabilities, again easily activated by drop down menus.

One of the features that I really enjoy in using Atari Works is the exceptionally easy mail merge capabilities with Atari Works database module. It's always been something of a pain for me to have to mail merge. It seemed to me that there was never really a system that felt very intuitive to me for mail merging. With Works, there is a drop down menu called "Begin Merge" that allows you to begin the process. It's TERRIFIC!!! On the editing side of the coin, Works allows you to transpose letters that just need to be flip-flopped with a Control-T command. Its also "intelligent" about it's editing, in that if you begin moving around text, Works will recognize the need for additional spaces and automatically insert the spaces for you. There are also commands that will allow you to do a number of different text commands, like setting areas to all caps, or all lower case, and other text handling.

The word processor of Atari Works also supports the importation of standard ASCII text, the Microsoft Rich Text Format (RTF) files. This is an increasingly popular format used with PC and Mac word processors, like Microsoft Word. The logical extension of that is that your documents at work can be saved out as .RTF files, and readily brought into Atari Works with the formatting fully intact!!

The database portion of Atari Works will import .DBF files, tab delimited ASCII, and comma delimited ASCII. The Atari Works database is a breeze to set up and work with, too! If you start a new database file, the system begins prompting you for field names, until you tell it you're done. Once the fields are entered, you simply click on the fields and hold down the mouse button while you drag the field to the desired size! Simple, eh? You can add additional fields later by simply clicking on the database form with your mouse. Fields are moved about the page simply by clicking and dragging them. You can display the records in a form fashion, or in a list fashion that looks very spreadsheet-ish to me. :) Since everything in Atari Works is fully GEM compliant, you can also highlight portions of the database records, and save out the area as a GEM metafile and drop it into your document! Of course, this also applies to the spreadsheet as well. That makes displaying graphs and tables as part of your document easier than it's ever been before.

Bill Rehbock, the product manager for Atari Works, tells me that the database portion of Works will feel very familiar to anyone that has ever used a database on a Mac. My sentiment was that I didn't find an overpowering need to run to the docs just to get things going, the database has a very comfortable "feel" to it. I'm not generally comfortable with ANY database, so I have great confidence that most of you will really enjoy the database portion of Atari Works.

The spreadsheet portion of Atari Works is Excel command compatible. Our intention with the spreadsheet is not to compete

against stand alone products like LDW Power, but to provide a good, basic speadsheet for users to be able to chart, graph, and track their finances. We have some portions of our business presently tracking their finances under the spreadsheet of Atari Works.

I could go on a little bit longer about the spreadsheet, but I think I've gone on about as long as I dare on this opening. Let's see what kind of questions are out there, Lou!

<[Lou] ST.LOU> Bob, this is terrific news. Thank you for preparing these opening comments. Since we have so many new users with us tonight, could I please ask everyone to use the /nam (your name) command before you /rai your hands. Our first question is from Bob Frazier of the Kansas City Atari group. Go ahead Bob.

<[kcac-prez] B.FRAZIER2> Bob....I need to know if you found a firm date for the Kansas City Atari Fest..We are at a standstill

<BOB-BRODIE> Hi Bob, I spoke with Garry Tramiel today, and don't have a yes or no about our attending CES in June yet. The possibility exists that we might still have a booth at that show to launch the new Atari Jaguar Game Console. We'll pick this up in email later on, with Dorothy Brumleve. I also got a fax from the CT. Show folk, and they are looking at a June Show Date as well. I'm very happy that we have you online now here on GEnie, as it is making our planning for what is shaping up to be an EXTRAORDINARILY busy show summer much easier. I know that the gang from San Antonio, Indy, and Asheville also very much appreciate the cooperative spirit that you have shown. ga

<[Lou] ST.LOU> Bob... do you have any questions about the Falcon or Atari Works? You may have a followup.

<[kcac-prez] B.FRAZIER2> No....I just needed to know about the show date...Thanks...

<[Lou] ST.LOU> OK... our next question comes from JCD at New Dimensions.

<[JCD] NEWDIMENSION> Hi Bob. The upcoming Atari products are excellent as ususal, but are we really going to see an major increase in Atari's market share in the computer industry? Will Atari _finally_ understand that a national advertising campaign is desparately needed. It seems more advertising dollars are put toward the Lynx than the computer line. GA

<BOB-BRODIE> Hello, Jeff. Nice to see you again online tonight. As I have indicated in previous conferences, Atari has the confidence that this machine will be a tremendous success. Sam Tramiel indicated back in August of last year that Atari didn't have the same confidence in the Mega STE/TT030 line as a major success in the US, due to the pricing/features/performance

constraints. In short it's not a question of Atari finally understanding that they need a national advertising campaign, it's a question of Atari having the faith in a product that can be a national success. The Lynx is clearly a technically superior product to the other handhelds in the marketplace, which explains the advertising support that the Lynx has enjoyed. The Atari Falcon030 is also a product that represents a major technical advancement over the existing CPUs in the marketplace. As a new dealer, I'm sure that you can also understand the importance of not just having a product that you are a fan of, but a product that the public can see a real value in for them to buy. I know that you'll also be pleased to hear that the number of dealer inquiries since the article in BYTE have skyrocketed. You'll probably not be the only Atari dealer in your area for very long. ga

<[Lou] ST.LOU> JCD... there is quite a lineup of questioners. Please hold your additional question for now and /RAI again. Thanks. Next is Joe Torres.

<[STimpy!] J.TORRES17> I have a three part question on ATARI WORKS (YEAH!): 1)Does it support graphics (lite DTP)? 2) What resolutions will it support (falcon only?)? 3)Is it too early for price/availabilty for existing STe Users? GA

<BOB-BRODIE> Hiya, STimpy, it supports GEM metafiles in the word processor which are readily available both online here, and in packages from people like Migraph's Easy Draw. Atari Works will function in any mode that supports 80 columns, which of course includes ST Medium resolution. Pricing is still under discussion, but will include a bundling of SpeedoGDOS and about 14 BitStream fonts in the package. It will be competitive with other verions of WORKS that are already in the marketplace on other platforms. ga

<[Lou] ST.LOU> Bob... John Cole from Lexicor is our next guest. GA John...

<[Lexicor] J.COLE18> Bob, just got the latest version today, fast and great. My first bug report is that I just looked up the plural for 'spelling' and it's 'spelling' not 'spellings' as in the menu bar :-) Fantastic program and I cant wait for it and Falcon. GA

<BOB-BRODIE> John, glad to hear that you like it. The bug is probably related to the Indian roots of our programmer, Pradip Fatepuria. ga

<[Lou] ST.LOU> Thanks John. Next is Eric Nickolaise.

<E.NIKOLAISE2> Hi Bob! What is Atari doing to get Developer Support for the Jaguar game system?

<BOB-BRODIE> Hi Eric, most of that information is covered by non-disclosure at this point. I can tell you that we have development units out, to a number of very talented software houses now. We've

also had at least two developer conferences for Jaguar, one here and one in the UK. Both of them have been greeted with a great amount of enthusiasm by the developers and their publishers. ga

<[Lou] ST.LOU> Scott Lapham has our next question, Bob. GA Scott.

<[Scott L.] S.LAPHAM1> Bob. at the beginning of the conference, you said that the quality of the Falcons coming off the "new" line are much better than before. My question is are any of those units off the first line going to be sold? And if so, how would one tell if you bought a Falcon if it was off the first line or second? GA

<BOB-BRODIE> Scott, the units *_have_* been sold. They are already out the door in Germany. As long as you don't try to mail order one from Deutchland, you shouldn't have to worry about. it. ga

<[Lou] ST.LOU> Thanks Scott. Next is Robb Albright.

<[Robb] R.ALBRIGHT7> Bob, I hear that the deal with Ingram Micro (Distributor) has been tabled, and that Atari plans direct marketing for the first push for Falcon. Are there any deals set with larger chains to carry the Falcon, or any planned, and if not, what will be the way that thousands can get their hands on one?? ga

<BOB-BRODIE> Gee, Robb. That's new to me. Might I enquire what your source is for that information?

<[Robb] R.ALBRIGHT7> A local developer said he got this from Bill Rehbock about a month ago. ga

<BOB-BRODIE> Well, Robb, Thanks for bringing this rumor to the light of day. I appreciate the opportunity to dispel this type of disinformation at the earliest possible time. We have a number of different arrangements working for Falcon distribution, and I'm confident that the thousands of people that want to have Atari Falcon030s will be able to get them. Regardless of what you're un-named local developer might have suggested to you. <grin> ga

<[Lou] ST.LOU> Thanks for clarifying that Bob. Next we have I.DUCKETT... welcome.

<[Evil E] I.DUCKETT.> How will the release of the Falcon help, The STE user? GA

<BOB-BRODIE> I see why your nickname is Evil. <grin> How did the release of the Quadra help the Mac? How did the release of the 486 help the 386? The answer to that is it gives the STE user a higher quality machine to upgrade to that retains a high degree of software compatibility that protects your investment in software. Does it mean that the STE is obsolete? No. It does mean that you can upgrade to a newer, more powerful machine and not have to lose your investment in Atari and Atari related products. ga

<[Lou] ST.LOU> Good answer Bob. BTW folks... I have been using Atari Works on my ST and STE... runs great. Next we have Steve Miller. GA Steve..

<[Steve] S.MILLER58> Hi, I am a somewhat digruntled TT owner who has been an atari owner aince the ole 400 and this my question where is the TT going to be when the Falcon _finally_ makes its appearance? Is the 68030 going to be supported on both systems or will the TT be a fluke machine here in the US sticking me with $6000 worth of unsup. hardware? and if the TT is going to be 'supported' when is the software going to be there to take advantage of he 68030 and the math co??????

<BOB-BRODIE> The TT030 will continue to be a high end, powerful workstation even when the Falcon030 makes it's appearance NEXT MONTH here in the US. The 68030 will continue to be support on both systems. There are products already that take advantage of the 68030 and the FPU, like DynaCadd, all Lexicor products, and Calamus SL. In addition to those products, there are other things like PageStream and Touch Up that are very happy on a TT030, especially when they have a graphics card installed in it, like an AlberTT card, a Crazy Dots board, or a Matrix card. I've also seen an goodly number of Musicians that are happy with their TT030s, and development tools like Lattice C 5.5 that have 030 libraries and FPU libraries. ga

<[Lou] ST.LOU> Thank you Steve. T.WILSON is next, Bob.

<[Dark.Oak.Sof] T.WILSON14> Are we going to see more guidelines from Atari on building apps for MultiTOS? I'm writing a multi-tos Zmodem program and was wondering if I should make it with GDOS, clipboard support, or would a simple .ttp CLI-callable be ok?

<BOB-BRODIE> Are you a registered developer, Tim? Our last developer newsletter had an article on user interface guidelines.

<[Dark.Oak.Sof] T.WILSON14> I can't afford it at the moment, I'm using net knowledge.

<BOB-BRODIE> Net knowledge is a little too far from the source, and I urge you to register as a developer at the earliest possible time. We provide a good deal of documentation to the developers as a portion of the MultiTOS distribution packet. Right now, that is only available to registered developers, and most of the support is done online, in our Atari.RSC area here on GEnie. ga

<[Lou] ST.LOU> Mike McFee from Pittsburg, California is next Bob.

<M.MCFEE> BOB when will MultiTOS be out for the TT if at all?

<BOB-BRODIE> Hi Mike, it will be released for all Atari Computers, as I THINK I indicated in my last conference. :) As I indicated in my opening remarks tonight, we're still having discussions regarding the distribution method to be used with MultiTOS. I

remain a staunch proponent of the "upload it and let nature take it's course" stance, but cannot guarantee that we'll be doing that. The product is done, we just have decisions to make now. ga

<[Lou] ST.LOU> I have a little surprise for everyone... we have a free one year subscription to EXPLORER to give away. Then Scott Lapham will have the next question. Here goes a roll of the dice....

<[Lou] ST.LOU> Job 24... you win! Dorothy!!!!

<BOB-BRODIE> It's not a fix, I swear it is not a rigged deal you guys!!!!

<[Lou] ST.LOU> Dorothy is the winner! Dot... any words? ;-)

<D.A.BRUMLEVE> Thank you, thank you! Maybe this subscription will actually arrive at my door! My other one hasn't. ;-) And I've been so interested to see how the new staff is coming! So thank you very, very much!

<[Lou] ST.LOU> Next we have Scott Lapham....

<[Scott L.] S.LAPHAM1> Bob, have you heard any new news on any products that will allow the SLM lasers to work on the Falcon?? GA

<[Lou] ST.LOU> Bob says he has another subscription to give away folks. Right after this answer.

<BOB-BRODIE> Scott, sorry for the delay, was sending. :) Yes, I have. There is a company that is working on this product, and we have discussions scheduled with them this next week to ensure that it WILL BE DONE, and users of SLM series laser printers will be able to use it with the Atari Falcon030. ga

<[Lou] ST.LOU> OK... here goes another roll of the dice.... Job 15... Chuck Haines is the winner of a free one year subscription to Explorer! Congratulations. Any comments Chuck?

Chuck is speechless!

<E.NIKOLAISE2> Does anyone (if so who?) make a VME RAM board that can be used with the Mega STE? Thanks! GA

<[Lou] ST.LOU> Folks, there are only two in the queue. This is a good time to /raise if you have a question.

<BOB-BRODIE> Erik, I'm not aware of any such ram board. I've heard that they do exist on the VME bus, but don't think that the software exists to make our system aware of the ram once such a board has been installed. ga

<[Lou] ST.LOU> Next is Robb Albright.

<[Robb] R.ALBRIGHT7> Bob, any announcements of terrific, *BLOW-EM-AWAY*, mind boggling games that will be released for the Falcon.

Either planned or set-in stone. ga

<BOB-BRODIE> Robb, there are about 35 games that are being developed for... the Atari Falcon030. Most of them are better than anything... that I have seen on any other computer game anywhere. And for that matter, better than most of the console games, too. We covered that in an edition of Atari Explorer Online a coule oops Couple of weeks ago, when we had a review of them from Andreas Barbiero when he came over to the office and sat down with a Falcon030, and one of those really cool joysticks for about oh...three hours or so. :) In particular, the sound is dramatically better than any other system that I've heard. I'm sure that we'll be able to convince Andreas to come back to the office again, to write a few more lines about Falcon gaming without too much arm twisting...at least until it's time for him to leave the office. :) ga

<[Lou] ST.LOU> Steve Miller is back with another question for you, Bob. Oh, and thanks, Robb.

<[Steve] S.MILLER58> Is the Atari community ever going to be tightened between us and Europe so that when new and interesting software/hardware comes out there, we can take advantage of it here? It seem as if we always have to wait for A LONG time for it to trickle down to us. GA

<BOB-BRODIE> Steve, much of that depends on distribution arrangements. Some of the developers don't like to have to support their products overseas, or mess around with translations. I know that some of the German developers have a hard time with the needs of the US users, as they have a particular view on things like users interface. :) But we are working on those arrangements, and I expect that you will be pleased with the way that things are going to turn out. ga

<[Lou] ST.LOU> I Duckett has another question too.

<[Evil E] I.DUCKETT.> Is there any way I can get info on the Falcon here in New York and support for all Atari system in my area?

<BOB-BRODIE> Regarding info on the Falcon030, there is a wealth of info in the Atari BB area right here on GEnie. We've posted a HUGE amount of information in a number of conferences, and in the BB message area itself. I'd suggest that you look at those files first. After that, I'd suggest one of the high quality mags that are out in the marketplace, like our own Atari Explorer Magazine or the equally wonderful AtariUser Magazine. Both of them do a excellent job of being factual in their reporting. And of course, be sure to check the weekly issues of Z*Net Online Magazine, which is also uploaded here weekly in the Atari Roundtable. We upload our own online magazine, Atari Explorer Online Magazine

here bi-weekly. That should give you plenty of reading material about the Falcon030. As far as support goes, why don't you send me e-mail with your specific questions and I'll be happy to deal with them personally rather than tie things up here any longer tonight. :) ga

<[Lou] ST.LOU> I.Duckett... I suggest you use FEEDBACK and you will get lots of help from my fellow sysops! ;-) Next we have Joe Torres, then Bob Frazier, Mike Allen and Andreas Barbiero.

<[STimpy!] J.TORRES17> (Let me just put down my LYNX - Pinball Jam :>) Does SPEEDOGDOS support a wider range of printers than FontGDOS does/did? I have a Panasonic KXP1142pi printer and was basically told by tech-support 'tough luck'

<BOB-BRODIE> SpeedoGDOS has support for the following printers at this point.. Atari Laser printer, SMM-804, Canon Bubble Jet 10e, Epson FX-80.
Epson LQ-570, HP PaintJet, DeskJet 500, HP LaserJet, NEC P Series Okimate 20, Star NB24-15, Star NX-1000, and of course, STraight Fax as well. :) You should be able to use the Epson LQ-570 driver with your unit. Just be sure that you have the dip switche in the Epson emulation mode. Have you tried that yet? Most of the time you have to have the printer off when you change the switches, and then re-start it. ga

<[Lou] ST.LOU> Thanks... now fellow sysop and RTC Shotgun <shogun?>... Mike Allen

<MIKE-ALLEN> Bob - I wonder if the SpeedoGDOS/Works combo is going to be available through Atari dealers in the near future? I'd really like to support my local dealer.

Also I still have to disagree about the Mega STe. I really feel that it is a product that suffered from improper marketing. A good product that no one outside of the Atari user community knew about. ga.

<BOB-BRODIE> Mike, I respect your opinion about the Mega STE, and share it. However, I don't own enough stock to change the decisions on that type of issue, and have to rely upon my persuasive ability from time to time on those matters. I think that part of the reason that the Mega STE didn't get a better "shove" is because the Falcon030 was expected sooner that this time frame. Now, re the shipments of Atari Works/SpeedoGDOS, the manuals are.. being done now, I suspect that it will be in the March time frame as well. Not two weeks, but likely six weeks at the max. I'm still twisting a few arms here on a couple of points about Atari Works, like allowing the importation of IMG files as well as just GEM files. If we can have that added, I think it's worth a little delay in shipping the product. ga

<[Lou] ST.LOU> Andreas has been waiting very patiently :-) GA

<[Andreas@AEO] AEO.2> Bob, I have been inundated by info from NAMM, and while I might have missed something due to bad phone lines earlier tonite on it, I was wondering if you could comment further on the FEEDING frenzy that went on with the new dealers?

<BOB-BRODIE> Andreas, the timing for NAMM was excellent for us. The write ups in Keyboard, Electronic Musician, and EQ Magazine are very exciting, and it appeared that most of the show attendees had read the magazines. :) We got a large number of dealers that are very interested in the Falcon from NAMM, and expect even more

<[Lou] ST.LOU> Joe has the last question... unless I missed someone's /RAI ? GA Joe Torres...

<[STimpy!] J.TORRES17> I am concerned about the apparent throw away memory boards on the Falcon... The fact that you have either a 1, 4 OR 14 meg board. Why not a user expandable version (I would eventually like a 14 meg... GA

<BOB-BRODIE> Joe, there is simply not enough real estate for that to happen via a normal/conventional means like your basic throw away SIMMS <grin>. What is going to happen with the Falcon030 is the same thing that happened with the STE and Mega STE. People will buy bigger supplies of RAM, and try to sell or trade in their old memory units. Dealers will capitalize on this to have a ready source of ram available. There are already other developers that have announced plans for third party memory boards. For example, Zubair will have a board as well. However, it will not use SIMMS either. There is simply not enough room SIMMS in the Falcon case. ga

<[Lou] ST.LOU> Bob... two more questions and then a wrap... OK? First J.VOGH then John Stanley. GA J.VOGH.

<J.VOGH> What about PC boards for the Falcon? What is the staus of 468 emulation?

<BOB-BRODIE> Oh, that. Had me worried for a second there. As we reported in our online magazine, Atari Explorer Online at COMDEX, COMPO Software is working on a 486 board. I was personally assured by the company president, Theo Bruers, that the product would be done in March. It is to support the full VGA Color, etc, etc, etc. Although I recognize that having such an item is attractive to some people, I think that you will find that products like Atari Works will make you much less inclined to have to sully your machine with MS-DOS. <grin> ga

<[Lou] ST.LOU> Bob... last question from John Stanley...

<[John STanley] JLS> I got here late so this may have already been asked. What's the current eta for MultiTOS? (Ballpark estimates... 2 days, 2 weeks, 2 months, 2 __??__) ga

<BOB-BRODIE> You're right, it was already answered...:) It's done, and will be shipping with Falcons. We're still discussing internally here how we want to handle the distribution of the product to the existing user base. I guess the answer from most perspective will be 2 long. :) BTW, you also missed the drawings for free subscriptions to Atari Explorer, too! :) ga

<[Lou] ST.LOU> Bob... my local dealer wants to order 50 packages of Atari Works. Please tell me what he needs to do and can it be ordered directly from Atari by the individual user?

<BOB-BRODIE> Gee, Lou, he must have been really impressed with it!

<[Lou] ST.LOU> All I did was tell him about my beta copy!

<BOB-BRODIE> At this point, he can't. But we'll be making our dealers aware of all the pricing on Atari Works as soon as possible. The manual will probably be inserted here in the US in the Falcons at this point. It will be available via the normal sources, both directly from Atari, and from our distributors as well. ga

<[Lou] ST.LOU> Bob... what can I say.... I am really excited and can't bear the thought of a few more weeks. Let's hope that our next Dateline Atari! has some real shipping dates. Thank you once again for such a terrific evening. GA

<BOB-BRODIE> Thanks, Lou. As always, it's a pleasure to be online here on our official online resource, GEnie. Thanks to everyone for taking the time to be here tonight, and I hope that you got a little bit better feel for how things are progressing. In our next issue of Atari Explorer Online Magazine, we'll be featuring a preview of Atari Works, including screenshots of the program. It'll be up here in the libraries in about a week for you to download. Thanks again for attending!!

2315. How do u uncompress a '.Z' file using COMPRESS.TTP?

>at a sufficiently high frequency to keep up with quick movement.
>This is different from "the IKBD cannot send data to the CPU
>fast enough" but not contradictory either (the latter problem
>could also exist).

The problem is that the IKBD -> CPU link is at something like 5Kbaud,
which is quite sufficient for most applications... but I attached my
old mouse to the joystick port and tried to operate both simulataneously
(with a custom joystick handler that converted the joystick pulses into
mouse pulses). But the "joystick changes" created by the mouse overran
the serial link from IKBD to CPU, so I couldn't move my second mouse very
quickly :-). Since the IKBD samples the mouse port but converts the
"joystick changes" into mouse movement BEFORE sending the [now smaller]
information to the CPU, and since the data rate was pretty close to the
limit [can't really remember this, but I did calulations at the time],
I expect it really was the overloading of the serial link.

Pity... that would have been an excellent game of Air Hockey...

Actually, yes, there is one. It comes with the Hermes UUCP archive
(available at atari.archive). It handles 16 bit compression (as long as
you have enough memory). I use it every day to uncompress my news and
mail.

Of course you can turn off the cache on the Falcon. I know the General CPX
that comes with production machines has no option for it but I have one that
does. I also wrote a little TTP that can can switch it off/on and change the
processor speed too. That was quite handy for some benchmarking.

On a related note, I posted an article on the tech newsgroup a short time
back concerning a serious bug in the Falcon video hardware and was surprised
that there was next to no response. I know there aren't that many Falcons
about but it looks like nobody cares.

A word of warning may be appropriate here. Many colour TV's come with a
SCART connector, but (here in the U.K., at least) not all of those have
the RGB inputs connected to anything - a lot just have the composite video
input wired up. When I bought a new TV, I took the precaution of asking to
see the user manual first, and rejected one set because it did not have RGB
inputs, even though it did have a SCART plug.

You can connect the Atari ST to the composite video input, but the last time
I tried that, the picture was little better than the one obtained via the
modulator, and significantly inferior to the one obtained via RGB inputs.

Why has the CPU 16 bit, and video 32 bit then ???
THE DSP also has its own bus to main memory, 1MB/s..... + 96K of FAST
ram .... SO: dual prosessing!!!!!!

>
> *Concurrent DMA operations -> Falcon 68030 halts when DMA is taking place

What a poor discussion...

I am working on a Silicon Graphics Crimson and think it's a little bit faster than Amiga 4000 and Atari Falcon :-) Especially the 24bit realtime rendering. :-)

What about a new subject: C64 versus Crimson?
Or tomato- versus orange juice

Greetings.

Roland

Since there appears to be a Dungeon Master thread in full flow,
I'll post a few queries which I never really had answered before.
Firstly, what exactly does the "Put the gem back" puzzle do? I
don't think I ever tried taking it, as gems always seemed pretty
useless (or aren't they?) so I'd quite like to know.

If this is the one on level 9 of the game, you have to replace the gem beyond the portcullis where it was in order to open the portcullis. You get the gem in the first place by tripping a lever which opens the floor where it was, along with a chest of other stuff then collecting it from the level below. The puzzling requires throwing skills, and can be quite hard if your champions are too advanced at this point, as they then throw the gem too far through the portcullis and it lands beyond the correct spot and goes straight down a pit again. I have found a solution to this overstrength problem by getting the relevant champion to continually practice his throwing until such time as his stamina characteristic gets quite low, after which he can probably make a throw which is sufficiently weak to put the gem back on the pressure plate. I guess this could all be done with some other object which you don't want and which will fit back through the portcullis.

Regarding
the idea of finishing the game using only magic, it'd be quite
tricky. Has anyone tried it?
I don't think you can get through the first door on level 3 using
only magic, you have to chop it with an axe or some such.

Personally, I like trying to get
through as fast as possible using only one character; I've got
it down to about four and a half hours, although I skipped past
quite a lot on that. Anyone beaten that? (I do hope so, it'll

give me a new challenge :)

I believe I have done it in about four hours, using a single reincarnated champion (ie no levels of any skills at the start). The champion used was Chani. The rules I play are that the stop watch starts as soon as you can start to move through the hall of champions, saves are allowed and the stop watch stops while the game is being saved, however, if you screw up and die and have to go back to a save, the time spent since that save still counts as part of the overall time. And yes, you do need to miss a lot out, particularly early on. I am currently investigating doing the same in Chaos Strikes Back, again with a single reincarnated champion, and I think it's feasible though quite delicate at the start. I have no idea what the time will be though.

Do 78 Hz also mean that the processor gets less bus cycles?

I Folks,

Sorry if my question is a FAQ:

Is it possible to hook up a MultiSync Monitor
to my St ?

I know that should be possible but I need more
detailed information, on which requirements have to
have such a monitor and how to connect it to my ST
(do I need to wire myself the cable?)

I own a 1040 St with Hi Rez Monocromatic Atari monitor,
and I'd like to use both my lovely Cubase and some
of the nice games and others color programs, without
2 monitors on my little desk...

Thanks in advance.

Savino

From: richardson@sscl.uwo.ca
Message-ID: <1993Feb8.093936.1@sscl.uwo.ca>
Source record: 210568

I was recently inquiring about an accelerator board for sale and it was mentioned that it could accomodate a 68881 co-procesor chip...which speeds up math processing I guess. Anyway, my question is: does a program need to be designed to use a chip like this or will it speed up ALL math processes. Specifically, would a chip like this speed up stuff like raytracing, de-arcing, and de-compressing pics etc.! Just curious :^)

Is there a program that swaps the joystick ports so that you can stick
your mouse into the mouse port on the left of the TT/Mega STe keyboard?
If your cable is long enough (mine is) that would solve the
cable-is-in-the-way problem. I checked the dc******.prg list, but there
doesn't seem to be such a program.

That doesn't necessarily have to be so. The 030 will still take 1 cycle, but
the memory of a Falcon (BTW, ST Ram on a TT works the same) may be slower
because of the multiplexing. There is no way a 030 will take more cycles for
an operation because something outside the processor is organised in a
different way, is there?

Falcon shares video bus with CPU bus resulting in DMA contention.
This means that there is not a 'fast mem' scheme like that one of the A1200
unless you expand the Falcon through the 'direct slot' or whatever it is
IF after all it doesn't share the same bus. And wasn't the DSP 32k?

No processing time... BS. Games in 640x480 will come out for the A1200.

And BTW about processing time, remember the A1200 has 8 64 bit wide/16 color
depth PLUS dual playfields... That will do something that the Falcon
just isn't able to do.

Minter made a game with 10 paralax scrolling? The old Amigas have
done better (well, not in 640x480 in 8bit color, but then the A1200 would

can do it).

In responce to your desire to find a packer sutable for NetHack3.01 I tried many as well last night and the only one that worked for me was JAM PACK (4 i think.)

It took the file from the 900K+ down to about 485K i believe, definatly under 500K.

I hope this helps,

Keith
(ps, i have tested it for about an hour after that and it seems to work fine.)

2339. waiting for events while reading stdin ???

Newsgroup: comp.sys.atari.st
Date: 1993-02-08 14:55:58 UTC
From: alexlehm@iti.informatik.th-darmstadt.de
Message-ID: <1993Feb8.145558.18482@news.th-darmstadt.de>
Source record: 210576

Hello people,

I can across the following problem while porting a program to multiAES:
When the program is started from mw, it calls appl_init and becomes the top application. This means that all keys can be read via evnt_keybd. The program does some terminal IO which appear in the mw window. The input from mw is ignored, which is ok since the program has it's own readline implementation which I modified to read the keys via the envt_keybd call.

If however the mw window is topped again, no more keys reach the application, since it never checks stdin. This means that one has to top the other application again to get any input to it.

My question is now the following: is it possible under MiNT/MultiAES to wait for keys from stdin while at the same time waiting for keyboard (and other) events from the AES.

I would appreciate any tricks that could help me solve the problem.

Thanks in advance ... Alexander Lehmann

BTW. the application I am developing is GNUPLOT 3.3 which will be released in sources from within the next month or so. I will try to post the binary to comp.binaries.atari.st, if there is enough interest.

--
If possible, please reply to me directly, since our newsfeed is currently not working (mail does however).

2340. Compressing the nethack 3.1 binary

Newsgroup: comp.sys.atari.st
Date: 1993-02-08 14:57:37 UTC
From: christof@wowbagger.pc-labor.uni-bremen.de
Message-ID: <1993Feb8.145737.27880@informatik.uni-bremen.de>
Source record: 210577

The problem of creating a compressed executable binary of nethack 3.1 for use from floppy disk has been solved. Using Ice-Pack 2.1.1 produces a result that seems to work all right.

I'm going to put it on the server this week (can't yet say exactly when). Let me know if there are any problems with it.

Still, if anyone has something better than Ice-Pack 2.1.1 (faster decompression, for example), and if it's free (and works), please mail me a copy.

Thanks,

Christoph

>It is interesting how they refer to a "True Color" mode. I am fairly
>sure that it is not 24 bit color. I would not call 262k colors true
>color.

And again...

"True Color", as referred to by Atari, is defined as "not have a palette." By this definition almost *any* number of colors in a particular resolution may be called true color if there is no limitation of a palette.

Then again, some people refer to "true color" as being synonymous with 24bit.

No doubt there are probably other definitions as well (hmmm, would 32-bit be called "really really true color"? :-)

Who's right? Who knows? "True Color" seems more of a marketing catch-phrase than a scientifically specific term.

Poetic license, perhaps?

Ok, the Domain server option is for the n890421 package (as well as bootp).
This version crashed on me whenever I tried to telnet to another machine.
In addition, the paths are determined by the program, instead of letting you
decide where to put the files.

As for the vt100, I also was wondering that. I hate using vt52, but see no
way right now to use the vt100 escape sequences with NET. Anyone else
out there who know how to do this, please let use know.

Recently, I inherited a bunch of discs that had a bunch -o- public domain stuff on 'em. Contained on one of those discs is micro emacs for the ST. Problem is, there is ABSOLUTELY NO documentation anywhere. I am uncertain what the version number is, but could some kind soul please send me the file called "keybind.doc."? When I press the 'HELP' key the editor asks me to "please visit file keybind.doc." I sure would appreciate it. Many thanks.

Source record: 210677

In the latest issue of the Z-Net online magazine, the good folks at Cottonwood Computers compiled a rather lengthy list of software that worked/did not work with the Falcon 030. I praise their efforts but wish to make a correction:

CYBERDROME-The Hoverjet Simulator _is_ compatible with the Falcon (& TT too)! Their report claimed it crashes and I can only surmise they must have been testing a very early version or else did not read the README.TXT file on disk. At any rate, it works fine on _my_ Falcon! (hint: try it on the Falcon in Cyberdrome's 8 MHz mode... hee hee!) Like most others, I do not have MultiTOS so I cannot vouch for compatiblity under that environment (yet).

And just in case anyone is curious, our other products (Crossword Creator II, Word Search Creator, Puzzle Pack, The Cryptographer) are also Falcon compatible.

First of all, is there a PD/shareware Pascal compiler out there that works?? I have the two from umich archive, but I can't figure out what to do...(the one, PP_DEMO, has German docs, (leider, mein Deutsch ist nicht so gut!) and the other, (PascalII) just burps, and complains, and basically doesn't do much. Does anyone have docs for these (more complete ones) or a compiler that works?!

Secondly, just a quirk that my 1040ST has and I'm wondering how to fix it. Sometimes when I enter or exit a folder, the mouse gets "reversed" somehow. I.E. Up is now down, down is now up, but weirdly, the left and right stay the same. Anyone else have this problem, can it be fixed?!

I'd like to play it on my 1Mb machine too, and I find it hard to believe a
game with no graphics and no sound won't fit. How far away is it from fitting
on a 1Mb system (with hard disk)?
Has anybody tried compiling it with optimisation for space rather than time,
relative addressing, regsiter function arg passing, global optimiser, shorter
printf and stdio replacement, 16-bit ints etc? I usually find this halves
the code size (admittedly in smallish programs).
How big is the biggest source file? If small enough to compile in 1Mb,
maybe I could have a go sometime.

- Leo

>
>I hope you're not suggesting that people with 1M will be able to run this
>when it's compressed...

Well, to begin with, I'm not *that* stupid... :-) No, of course you
won't save any memory (i.e. RAM) by compressing, how did you infer
that from my posting? :-) It's just that people who have 2 megs of
memory but no harddisk can't run the game from floppy for the simple
reason that 940K won't fit onto an normal DD disk (well, you *could*
format with 11 sectors per track and 84-86 tracks, but not all drives
work reliably at such excess settings).

>You'll need at least 2M of RAM for a version with all the options left
>in (the binary I built yesterday is about 1019k or so).

Yes.

Might be a good idea to strip the binary :-)

>You'll probably
>need 4M for a pfxpak'd version (since it'll have to load the compressed
>file, then unpack it to another region of memory).

No.

The compressed ST version I'm going to put on our ftp-server is about
550K in size, the uncompressed binary is 940K. So it should fit in 2MB
easily. The compressed version definitely runs on my 3MB ST with 2.5MB
of memory left at startup time. I'll try with 2MB left tonight when I
come home.

I'll admit that one slipped by me.. Maybe you're talking about the blitter having 32-bit access to memory?? I don't know of any 'general' 32-bit graphics bus in the Falcon - video is part of standard RAM, which has a 16-bit interface to the CPU. So, you can move little bits of the screen around quickly, but to fill a screen would take some time..

Just for fun, I'll throw out a little cannon fodder:

2354. Need HELP with "DR. T's" sequencing Software

Newsgroup: comp.sys.atari.st
Date: 1993-02-08 19:41:54 UTC
From: M14563@mwvm.mitre.org
Message-ID: <16B6FCECC.M14563@mwvm.mitre.org>
Source record: 210587

I am a NEW ATARI-1040ST user. Presently, I am using my Atari to help me sequence music. I have purchased the most recent version of the KCS's "Dr. T's" software (Omega version ?). Though I have become somewhat familiar with this package, I am experiencing a few problems with it. My most frustrating problem with this software involves the "looping" of tracks and/or sequences. Even after painstakingly following all instructions on how to end up with a "clean" loop for a track or sequence, (ie. making sure that the last "deleted event" falls on the first step of the first beat of the first measure AFTER the last measure of real music -- that is, for a 15 bar song, the deleted event should fall on the first step of the first beat of measure 16!) I still experience slight, but VERY NOTICEABLE hesitations when looping from the end of a track/sequence back to the beginning of that track/sequence. I have used quantization where possible, and this helps some, but NOT in all cases. I've tried moving/deleting control changes, modifying durations, changing timings, you name it! I am hoping that someone out there will be able to help me with this problem. I have some important work to do involving this sequencing, so would appreciate any and all assistance in this matter. (Oh, by the way, I did call Dr. T's technical support line and talked to them for about one hour about this and other problems. Unfortunately, they could give me any additional insight into this particular problem.)

My configuration is an Atari-1040ST with 4MB RAM. I am running the software from a DD floppy drive.

I would also be interested in knowing how the package "Master Tracks Pro" (?) compares with the Dr. T's package. I have heard a few negative things about Dr. T's and have heard that "Master Tracks" is better. Could someone out there give me a brief pros and cons list? (And, if by chance you have a pros and cons list for Dr T's, that would also be appreciated.)

In advance, thank you so very much for your time and help.

>*IF* after all it doesn't share the same bus. And wasn't the DSP 32k?

The DSP has 96K bytes or 32K words of 0 wait state static RAM.

Until one of you Amigans actually coughs up benchmark results showing the available bus bandwidth on an A4000 or A1200 in a varied selection of screen resolutions, your claims about Falcon bus contention are just so much hot air. Just as an example that I posted before, on the Falcon in 640x480 monochrome, no CPU/video contention occurs, and the CPU can transfer a full 32M byte/sec over the bus using longword accesses, or 16MB/sec using word accesses. Simple assembly language code to run a bus test has been posted twice now to these newsgroups, in both Motorola and MIT assembler syntax, yet nobody has taken the few minutes required to generate some results on any Amigas. Of the replies I got to my posting of the code, the only Amigan who responded said "sorry, I don't have an A1200 to test on."

What's the deal here? Where are all the A1200 owners that should be out there? How long has the A1200 been available for sale now? Don't any of you own a C compiler and assembler? Don't any of you *care* to know the actual bandwidth of your system bus in bytes per second, or are you all just happy to spout on about how "my system has fast RAM so it's better than yours" ??

To the Atari readers - it's way past time that this discussion thread died. We're obviously not getting any facts from the Amiga camp, so any further discussion is merely a shouting match. I admit I was very much interested in comparing the available systems, when I first thought that an objective comparison might be possible, using hard numbers, but at this point, it seems that no Amigan wants to provide factual data to actually compare. It's just the same old baiting game, and nobody needs it.

Even if this was possible, which it probably isn't (since the TOS roms are fairly position-dependent, unless you have the assembler source), it would be either illegal, immoral, or fattening. :)

> to be able to operate under the older TOS at times. (Especially since
> Bards Tale, one of my favourite games only runs under that version of
> TOS)

Not true. Bard's Tale can be made to run fine on an STe, you need a small patch program that involves setting up a special ram disk. Someone posted this for me to atari.archive, but last time I checked it wasn't there. :(However, with the patch I don't think it works in 1 meg anymore, you need at least 2 (it just goes slightly over 1 meg). You should jam in some SIMMs anyway, 1 meg isn't really enough nowadays, except solely for games. I could probably be convinced to find it and mail it to someone, I don't have ftp upload capability.

> -- thanks, Dave / Gadgets

I've tried a ProDOS disk and it worked, sort of. I got one file off
before the machine started to buzz the drive. I attribute that to the
fact that the person who gave me the disk (GCR format - you oughta
know Woz did it for the Apple][first Dave! 8-) happened to send me a

ProDOS formatted HD disk, and even a regular Mac had trouble with it until I taped the *underside* of the HD sense hole. In general I find that St drives hate HD disks, even when formatted low density - and those guys keep selling all those hole punches (to fake out drives that sense the HD hole)! Hope this helps the original questioner, AFE is sure cheaper than the other programs you mentioned, but I also had to write a CR to CR/LF utility for myself 8-(.

Monochrome? I guess that'd be a 0-bit display. No the Amiga can't
transfer _anything_ across the bus while it's in monochrome mode, because that
generally means it's either unplugged or dead. :-)
If you mean a two-color screen, most Amigas would have no contention
problems there. I'd like to see someone run such speed testing on both
an AGA and ECS Amiga.

>only Amigan who responded said "sorry, I don't have an A1200 to test on."

Sorry, I don't have an A1200 to test on. :-)
I do have a 3000, though... if someone gets your benchmark compiled,
I'd be happy to try it out.

>What's the deal here? Where are all the A1200 owners that should be out
>there? How long has the A1200 been available for sale now? Don't any of you

That's exactly what it is... a rumour.

Sorry folks, you can hope and dream all you want but the Falcon 030 will be shipped in the 'ol 1040ST style case. That doesn't prevent Atari from selling a faster 030 or 040 system in a new case style (e.g., mid-tower) later on, of course. Like everyone else, I wish Atari had designed the Falcon differently, but it's now an open and shut (mostly _shut_) case. :) Complaints aside, it's still kinda neat to have all those goodies crammed into that ST box.

Hello, this is my first posting, but I have seen there are a lot of people posting from EE and CSC depts. from around the world.

I have been using a version of Berkeley SPICE for my electrical engineering classes on my TT however, it is a 1981 version ported to the ATARI in 1986

DOES ANYONE KNOW OF A MORE RECENT VERSION THAT PERHAPS HAS A GRAPHICS POST PROCESSOR??

If you know of one on an internet ftp site or elsewhere I would be very appreciative to know of it. Thank you!

Steve Miller (not the band mind you)

smiller@farad.elee.calpoly.edu

and by the way my TT stomps, wait no STOMPS over any 386 when I am running the circuit simualtions, and I am using a 6 year old program and they a brand new one. My TT runs somewhere in the neighborhood of 100-200 times faster If you disagree I'll post my results at a later date if you want 'em.

thanks again

Hmmm... sounds like the old "mouse virus" (or whatever its popular name is)
has gotcha. It's harmless, but irritating. Try booting your system from a
known clean boot disk and see if it shows up again. And download one of the
virus killers and inspect your system boot disk for nasties. This one is
fairly easy to eradicate, as I recall someone saying here not long ago.

2367. Atari 1040ST and accessories FOR SALE

Newsgroup: comp.sys.atari.st
Date: 1993-02-08 22:57:30 UTC
From: eggert@sun.lclark.edu
Message-ID: <1993Feb8.225730.1018@lclark.edu>
Source record: 210599

I still have the following items for sale: $350 Takes all, or split up as follows...

Atari 1040 STf - $190
1 meg RAM
with Atari mouse
Atari SC1224 - $75
Screen bows at top and bottom. This is
apparently due to a burned out capacitor.
Should be an easy fix.
VideoKey - $50
Use a TV or VCR with your ST.
Works great!
Monitor Master - $29
Switch monitors without unplugging
and plugging.

Software -
Laser C compiler. . . . $30| or both for
Laser C Debugger package. . . $20| $40
GST C Compiler $10
Personal Pascal $10
Quantum Paint $8
BBS Express! ST $20
Universal Military Simulator . . $12
Falcon Flight Simulator. . . $18
Bloodwych $18
Chrono Quest $18
Carrier Command $18
Gone Fishin' $8

Again, all of this could be had for $350. I will pay shipping (within the U.S.) on any of this assuming it is pre-paid. I will ship c.o.d. if desired, but I ask that the buyer pays for that ahead of time (I got royally screwed on a previous deal that ALL of this was supposed to go with).

Check all your disks for viruses. There is a virus that sometimes
reverses the mouse for fun. I think it is harmless otherwise, but
it should be eliminated anyway.

I'm not a PC enthusiast, but, like Dave Baggett, misinformation bugs me:

1) Windows SUCKS for trying to get any performance out of your machine.
2) Turn _off_ the swapfile (in the 386Enhanced Mode part of the Control
Panel), it'll double the "speed" of your machine.
3) 4M is _not_ enough RAM for Windows. 8M is getting there.

> **

Try #2 and do it again. Then again, DOS/Windows sucks rocks. The
Windows screen saver isn't smooth on the 8M '486/33 I use at work. It
sure does ray tracing fast though.

That's exactly what the original Atari official posting of Falcon030
specs said. Of course, they were wrong...

I'll beleive in a "professional" Falcon (ie, real case, 32-bit buses,
VME slot, etc) when I see one.

hello my friends. for those who know me i have returned.
my problem as usual is simple. i want to buy a falcon. my dealer, (in s.c.)
told me they were getting their falcons on a specified date pretty soon.
i am a student who needs an atari for the following reasons
1) i have a lot of old st stuff.
2) i like ataris
i want to know what packages, multisync monitor, and hardisk options are
available. i also want to know if there is an X Window emulator for
the falcon or some tcp/ip package cos we are very unix inclined at this school.
i am also planning to try writing games and am interested in what assemblers
support this machine.
to david small i ask: what are your plans for falcon support ??
also can i use an nec cd rom drive with the falcon, and can i sample off it ??

thanx :

hello to hackbear: howie: dr. nibble: tanman: knightman: xyvark: gcsh : abel

In article <C25MIv.Lor@ecf.toronto.edu> giggey@ecf.toronto.edu (GIGGEY Mike S) writes:
>True color is a standard. 24 bit color is a different thing altogether.

How is true color a standard? As I understand it, many companies are claiming "true color" for 15 and 16 bit video modes, in which each pixel may be one of the 32k or 64k possible colors. While this is not bad in itself, the way it is presented can be somewhat misleading.

For example, could we not consider the Commodore 64 to have true color by that definition? After all, it does not have the notion of a palette and all 16 colors can be used in certain modes. For that matter, any machine which allows for any pixel to be any one of the possible colors could be considered true color by the definition being so carelessly tossed about.

One question that I have asked before but have yet to receive a definite answer regards the range of colors in the true color palette. Simple math shows that there are only 32 shades of each red, green, and blue in a 15 bit palette, and possibly 64 of one of the shades in a 16 bit palette. This is not bad compared to the Amiga's 16 or the original ST's 8, but it pales next to the AGA Amiga's 256 and even the VGA's 64 shades. The total number of colors should be plenty for photorealistic images, but what if one wishes to generate smoothly shaded objects with a renderer? There are many who claim that 256 shades are not enough, much less only 32...

Now, maybe someone will correct me and say that the Falcon has a 24 bit palette in the true color mode. But if it does, should it not also allow each pixel to be one of ~16.7M instead of one of 32k or 64k? This is not intended to start a flame war, I'd just like a bit of clarification...

Should it really be that big? The Amiga version's binary is 801K, which
is pretty hefty :-/ The person that compiled might want to try it again
with a few more optimizations on... The first port of the Amiga NetHack
ballooned out to about 1.4 meg (I think)

Regards,

Jim

2379. What kind of a name is Falcon030?

Newsgroup: comp.sys.atari.st
Date: 1993-02-09 03:15:20 UTC
From: brymastr@eng.umd.edu
Message-ID: <1l77k8INNiaj@mojo.eng.umd.edu>

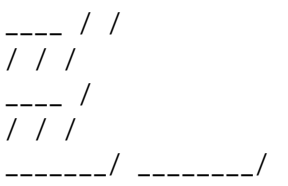
I think the Falcon sounds like a pretty cool machine, and I'm waiting
to see the real thing, but what kind of a name is 'Falcon030' ??
I know it has a 68030, but still that name bothers me. Couldn't they
call it the 'Falcon 30' or the 'Falcon 3'? Just plain 'Falcon' suits me
fine.



2380. MINT distribution kit..

I have collected most of the MINT distribution kit and have a few queries...

1. My screen length is set to about 20 lines.. This is true even when you
view a file from the GEM desktop.

2. I run a shell - KSH but the files I create are not owned by 'clive' (ME!)
how do I get around it?

Thats it...

..Clive

Yes, you are right. Atari is shipping the Falcon030 in a one piece case.

I have heard though, that Atari plans to release two other computers
with the keyboards separate from the units in Fall, 1993.

Atari is just too busy making the Lynx, Falcon030, and Jaguar to worry
about the other higher-end computers right now. And they have reason to
do so. Guess how many SNES Nintendo plans to sell this year? Between
6 and 8 million. Sega plans to sell 6 million Genesis.

Imagine how many Jaguar systems Atari can sell, 2 million perhaps?

And perhaps another 1 million Lynx systems?

from the Hermes manuals.....

COMPRESS (1) Commands and Applications COMPRESS (1)

NAME
compress, uncompress, zcat - compress and expand data

SYNOPSIS
compress [-f] [-v] [-c] [-V] [-b bits] [name ...]
uncompress [-f] [-v] [-c] [-V] [name ...]
zcat [-V] [name ...]

DESCRIPTION
Compress reduces the size of the named files using adaptive Lempel-Ziv coding. Whenever possible, each file is replaced by one with the extension .Z, while keeping the same ownership modes, access and modification times. If no files are specified, the standard input is compressed to the standard output. Compressed files can be restored to their original form using uncompress or zcat.

The -f option will force compression of name. This is useful for compressing an entire directory, even if some of the files do not actually shrink. If -f is not given and compress is run in the foreground, the user is prompted as to whether an existing file should be overwritten.

The -c option makes compress/uncompress write to the standard output; no files are changed. The nondestructive behavior of zcat is identical to that of uncompress -c.

Compress uses the modified Lempel-Ziv algorithm popularized in "A Technique for High Performance Data Compression", Terry A. Welch, IEEE Computer, vol. 17, no. 6 (June 1984), pp. 8-19. Common substrings in the file are first replaced by 9-bit codes 257 and up. When code 512 is reached, the algorithm switches to 10-bit codes and continues to use more bits until the limit specified by the -b flag is reached (default 16). Bits must be between 9 and 16. The default can be changed in the source to allow compress to be run on a smaller machine.

After the bits limit is attained, compress periodically checks the compression ratio. If it is increasing, compress continues to use the existing code dictionary. However, if the compression ratio decreases, compress discards the table of substrings and rebuilds it from scratch. This allows the algorithm to adapt to the next "block" of the file.

Note that the -b flag is omitted for uncompress, since the bits parameter specified during compression is encoded within the output, along with a magic number to ensure that neither decompression of random data nor recompression of compressed data is attempted.

The amount of compression obtained depends on the size of the input, the number of bits per code, and the distribution of common substrings. Typically, text such as source code or English is reduced by 50-60%. Compression is generally much better than that achieved by Huffman coding (as used in pack), or adaptive Huffman coding (compact), and takes less time to compute.

Under the -v option, a message is printed yielding the percentage of reduction for each file compressed.

If the -V option is specified, the current version and compile options are printed on stderr.

Exit status is normally 0; if the last file is larger after (attempted) compression, the status is 2; if an error occurs, exit status is 1.

SEE ALSO
pack(1), compact(1)

DIAGNOSTICS
Usage: compress [-dfvcV] [-b maxbits] [file ...]
Invalid options were specified on the command line.
Missing maxbits
Maxbits must follow -b.
file: not in compressed format
The file specified to uncompress has not been compressed.
file: compressed with xx bits, can only handle yy bits
File was compressed by a program that could deal with more bits than the compress code on this machine.
Recompress the file with smaller bits.
file: already has .Z suffix -- no change
The file is assumed to be already compressed. Rename the file and try again.
file: filename too long to tack on .Z

The file cannot be compressed because its name is longer
than 12 characters. Rename and try again. This message
does not occur on BSD systems.
file already exists; do you wish to overwrite (y or n)?
Respond "y" if you want the output file to be replaced;
"n" if not.
uncompress: corrupt input
A SIGSEGV violation was detected which usually means
that the input file has been corrupted.
Compression: xx.xx%
Percentage of the input saved by compression. (Relevant
only for -v.)
-- not a regular file: unchanged
When the input file is not a regular file, (e.g. a
directory), it is left unaltered.
-- has xx other links: unchanged
The input file has links; it is left unchanged. See

ln(1) for more information.
-- file unchanged
No savings is achieved by compression. The input
remains virgin.

BUGS
Although compressed files are compatible between machines with
large memory, -b12 should be used for file transfer to
architectures with a small process data space (64KB or less, as
exhibited by the DEC PDP series, the Intel 80286, etc.)

COPYRIGHT NOTE
This program is supplied with HERMES for your convenience. It
is not covered by the HERMES license regulations, and is in the
public domain, as far as I know.

John Richardson asked about using a math coprocessor in an ST...

As you surmised, programs MUST be specially compiled to take advantage of a math coprocessor chip.

The number of programs available for the ST which can use a math coprocessor is virtually zero.

I just uploaded a nice game called traps to atari.archive.umich.edu and
to ftp.uni-muenster.de
It should be available during the next days.
It is a very good implementation of a minesweeper-type game for the
atari (ST, TT and so on), so get it and have fun!

wrote:
>(an interesting comparison of ST and PC disk formatting speed and
>compatibilty)

I myself had some strange experinces with ST and PC disks.
My PC at work reads ST formatted disks fine as long as the first three bytes
of the boot sector are EB 34 90. This even works for 10SPT disks since DOS 5
does not seem to mind. However my PC at home, also running DOS 5, reads ST
disks really slowly and sometimes gets errors. I wondered why so I formatted
four disks on the ST all with completely genuine MS-DOS boot sectors.

9 SPT-no skewing, 9 SPT-skewed, 10 SPT-no skewing, 10 SPT-skewed.

The PC would read none of the disks fast/reliably. *BUT* When I formatted the
disks exactly the same again using the Falcon they were all perfectly
readable by the PC. Why? The Falcon has a high-density disk drive. It seems
that my PC does not like low-density disks that were written using a
low-density drive. I have seen other PC's with this problem.
I also find that the Falcon drive reads just about anything that my PC has
trouble with and that includes high-density disks too.

On a related note, I found that Flopfmt on the Falcon will format a track as
high density if the SPT is greater than 12. This is fine but I don't know
how to write the track after that since the hardware defaults to low-density.
I guess I need to pass some sort of flag to Flopwr but what? The dev-docs
say nothing about this (what's new?) which is a pity because I was planning
on a 1.6Mb (20 SPT) disk formatter. Anyone got any ideas?

2394. Extra disk to Megafile 30

Newsgroup: comp.sys.atari.st
Date: 1993-02-09 12:59:22 UTC
From: d70@nikhefh.nikhef.nl
Message-ID: <2194@nikhefh.nikhef.nl>
Source record: 210683

Hi there!

I still have a 1040STf + Megafile 30, and now I'm offered a 105 MB RLL-disk, which I think could be connected to the Megafile's controller without much trouble. Actually, I think some magazine gave some details about that several years ago, but I can't find it anymore.

Can somebody tell me what kind of software I'll need to have TOS find (and format/partition etc.) this disk? Any problems I'm likely to forget?

Also: will this setup still work when I swap to 1040 for a Falcon?

Thanx ------ Bram

>color.

It is a 32768/65536 out of 32768/65536 colors mode. It is refered to as
'true color' because it does not use a palette instead you have 5 bits per
primary color (the 65536 mode has 6bits red (green? blue?)).

>Only a true moron would use A1200 without FAST ram. I think Commodore
>made a major mistake not to put say 2 megs of Fast ram to the A1200
>in addition to the 2MB chip it already has.

Not sure if it is a mistake. 2MB more memory would have increased the
price significantly. Even a 1MB chip+1MB fast version would have been
more expensive since they'd need additional space on the motherboard
for the fast memory. The fact that the first A1200 models hat a connector
for a 1MB chip memory expansion shows that they did even think about
selling a 1MB chip-only version to reduce the price.

What they should have done IMHO is to add the RTC and an 68881 socket and
sell a Fast RAM expansion right from the beginning.

BTW, does anyone know wether a 68881 soldered to the motherboards SMD pads
would work ? Does it conflict with 68881s on trapdoor boards ?

|> only Amigan who responded said "sorry, I don't have an A1200 to test on."

I can claim the Amiga has no bus contention @ resolutions of 640x400 with
4 bit planes (read 16 colors) and 320x200 in 8 bitplanes (256 colors or
256K colors). It *seems* that it has no bus contention either @320x400
with 8 bitplanes from what I have used an A4000 so far, and theoretically
it shouldn't since 320x400 in 8 bitplanes == memory in 640x400 in 4 bitplanes.

I do know that there is *heavy* bus contention @ 1280x400 in 8 bitplanes,
specially in overscan, although I don't know what is the slowdown.

So no bus contention occurs for the Falcon in Monochrome, big deal, neither
on the old Amigas. Now, you got a point, we have to do some benchmarking

with the A1200. Well, let's see when I get one at the end of this month,
I'll do some C tests if I get a compiler.

All I know is this and this from an engineering point of view should be
obvious:

If the Falcon has a 68030 with a 16 bit data path do memory AND
the video bus is shared with the CPU bus AND
there is bus contention in some hi res configurations AND
the Amiga 1200 has a 32-bit data path to memory AND
the Amiga 1200 has an alternate bus where the cpu can access the
memory at full speed ('fast ram') THEN

The A1200 should be faster accessing RAM. Well, it happens that all
of the above are *true*.

|>
|> What's the deal here? Where are all the A1200 owners that should be out
|> there? How long has the A1200 been available for sale now? Don't any of you
|> own a C compiler and assembler? Don't any of you *care* to know the actual
|> bandwidth of your system bus in bytes per second, or are you all just happy
|> to spout on about how "my system has fast RAM so it's better than yours" ??

Well, some people will not care, as a lot of Falcon people won't care
either. I agree that the Falcon has strong points and is a nice machine
for a lot of things.

And yes, since the A1200 has fast ram, it's faster than yours. Input
/output to and from the computer should be the exception, where the Falcon
seems to be faster.

|>
|> To the Atari readers - it's way past time that this discussion thread died.
|> We're obviously not getting any facts from the Amiga camp, so any further

You got some above... I still owe you the benchmarks, so you got a point.

|> discussion is merely a shouting match. I admit I was very much interested in
|> comparing the available systems, when I first thought that an objective
|> comparison might be possible, using hard numbers, but at this point, it

|> If you mean a two-color screen, most Amigas would have no contention
|> problems there. I'd like to see someone run such speed testing on both
|> an AGA and ECS Amiga.

ALL AMIGAS have *NO* bus contention in 640x400 in 1 color. AGA should
have NO contention even in 1280x400 or 800x600 in 1 color since they
have 4 times the bandwitdth.

2399. Z*NET Atari International Issue 9306 released in alt.znet.pc

Newsgroup: comp.sys.atari.st
Date: 1993-02-09 13:24:30 UTC
From: jonc@status.gen.nz
Message-ID: <JFkoyB2w165w@status.gen.nz>
Source record: 210688

Greeting infojunkies,

This weeks issue of Z*NET Atari International is available in alt.znet.pc in full form and uue form.

There is also a copy of the brodie rtc on GEnie and lots of New PD software reviews.

Please note Z*NET is now released on Sunday (USA and Northern Dates) and on Monday (Southern Date) into the worlds nets, GEnie and the Atari related FNET's.

Writer Wanted: drop me a note here at the gateway if there is any news, tips, articles you have and we will post them direct to Ron and the crew in NJ .

Happy days from the Z*NET Crew

>lharc archives inside a zoo archive! Arghhh! Why not zoo (2.1) the whole
>damn tree!)

Because lots of people don't know zilch about ftp and binary mode transfer and installation and all that, and used to phone CS and ask silly questions (I know since I also get those questions). So, to make it easy for all those less-perfect-than-Ken-Newman people out there, I put the stuff into .zoo files. [There was no Unix lzh dearchiver for many systems.]

And CS didn't use zoo 2.1 because it didn't exist when he write his INSTALL tool. LHarc just packed better than zoo 2.01. Enough soapboxing. :-)

The latest version of Warp 9 is 3.75. I am currently using it. There were
two minor upgrades from 3.73 which were posted to GEnie to solve a few
compatability problems. That is why it is currently 3.75. Rumor mill says
that 4.0 will be out this summer.

My mac died a few weeks ago and I am looking for another computer.
Unfortunately, just to be "safe", my wife wants to get another Mac.
And, I don't feel like shelling out money for an inefficient machine.

Well, I have heard some good stuff about Atari, and I am considering
it. So, does anyone know how well does the Mac emulator work?
Could I even run a game, for example, like SimCity on it?

Also, what are the pros and cons of getting an Atari when compared
to a Mac?

I am not very PC literate(since I mostly work on a Unix system), but I
am computer literate.

Atari isnt as scary a word as most people think it is. I dont know much
about Mac emulation, except that there are software and hardware versions.
What I can tell you is that IBM emulation works very well (ie PC-DITTO):

2406. Graphics Questions (Technical).

Newsgroup: comp.sys.atari.st
Date: 1993-02-09 16:21:34 UTC
From: csg019@cch.coventry.ac.uk
Message-ID: <C26w41.3zw@cck.coventry.ac.uk>
Source record: 210694

Hello,
I may in the future start to write games for the ST (Falcon) or the new Amiga A1200. Having programmed the ST and Amiga, i wish to compare the games hardware (graphics) of these 2 machines. Please do not start the ST Vs Amiga stuff, as it is terminally boring. The information here is for my benefit, so i can choose the ideal machine.

A few questions:

Blitter: I have used the amiga blitter *extensively*, and it can cope with 3 sources (A,B and C) and 1 destination (D). The source can be shifted by upto 15 bits. The new A1200 now has a 64 bit bandwidth for all blitter operations. As the blitter is possibly the most importaint item for games hardware, i would appretiate any information regarding the Falcon blitter (i hear some bad rumours about barrel shifters and limited blitter operations (ie <256)).

Playfields: The old amiga used to able to have 2 seperate 3 bitplane playfiles, each with hardware pixel scroll in any direction, the A1200 allows 3 seperate playfiles or one 256 colour mode. What is the display hardware like on the falcon? The planes dont have to be aligned every 256 bytes to they? I would like to hear about the possible games modes (ie 320 * 200) that the falcon uses (please done talk about "true colour" as the DMA would be a killer).

Copper: Does the Falcon have a facility to display lists like the Atari 800 or the Amiga?

PS: How much is a standard Falcon? (2 meg ram, 1 floppy).

Thanks in advance!

Steve.

> to send.

Well, first of all you should get the latest version. Uniterm 2.0e011 is on
atari.archive, and 2.0e015 is available from somewhere (anyone remember?).
I used 2.0e011 for about a year with no problems. Anyway, you did not mention
which protocol you were using. I personally use ymodem batch, along with the
"xmodem" program for the Unix box (it also does ymodem batch). I use the
arguments:

xmodem sbcykl file(s)

s = send
b = binary
c = CRC checking
y = ymodem batch
k = 1k packets
l = no log file

Grab the program from ftp.uu.net, compile it, and run it with no arguments
for a help page. This, combined with Uniterm, works fine for me. Feel free
to email if you have problems.

Oops, I forgot to mention that changing "s" to "r" enables this program to
receive files (i.e. upload), and that works fine for me also. Typically
though, it is more convenient for me to put files on an IBM formatted
floppy and use my SPARC at work to read it. If you have access to a Sun
with a floppy drive, you should be able to do the same.

>My mac died a few weeks ago and I am looking for another computer.
>Unfortunately, just to be "safe", my wife wants to get another Mac.
>And, I don't feel like shelling out money for an inefficient machine.

If you want to be "safe" than get another Mac.

But, Atari is planning to release the FALCON030 next month and this machine
will be very good for the purpose of music and video (especially music).
Atari has combined both video and sound to make a very good multi-media
system.

TheFalcon030 has some very big advantages over other systems like the DSP chip
and port which may allow you to run your home with it in the future.

But, the Falcon030 also has its drawbacks. The case is in a ONE piece which
means that the CPU and keyboard are together.

The Falcon030 is also only 16 MHz though it should do the job for most
of what people want the computer to do.

It all depends what you will use it for.

If you are planning to get really into DTP, etc. I would either get a
Macintosh or wait until November and see what Atari is planning to release
that is a bit faster.

>
>Well, I have heard some good stuff about Atari, and I am considering
>it. So, does anyone know how well does the Mac emulator work?
>Could I even run a game, for example, like SimCity on it?

Dave Small's emulator does not work. He will not say either way if he is
working on an emulator that will work (and I'm sure many people are hoping
that he is).

And yes, SimCity is out for the ST (Falcon). I enjoy that game.
And I'm hoping that SimWorld, SimAnt, and other games are created for the
Falcon030.

>
>Also, what are the pros and cons of getting an Atari when compared
>to a Mac?

The pros are that you will never be bored with the Atari Community.
There is always something going on either in the Atari Community or at

Atari Corporation that will keep you on your toes.

You will also find that the Atari Community is more ACTIVE than the Macintosh Community. I'm not trying to start a flamewar, BUT, we are more active because we NEED to be.

The negatives is that the Macintosh has been around longer. The company is selling more Macs, there is more software, and more support.

The Macintosh is also well-known.

The Falcon030 is not yet and Atari has a lot of work ahead of them.

Pure C does have support for the math coprocessor; GCC has support for the TT (and presumably Falcon) 68881 installations. Unfortunately, on the Mega ST, the coprocessor is installed differently, and fairly incompatibly.

Yes, programs MUST be specially compiled. In addition, the 68881 would primarily be useful for accelerating floating point stuff. It wouldn't be much good in accelerating data compression, as was speculated. DSP might be helpful, but not FPA.

2413. Atari is dead

Newsgroup: comp.sys.atari.st
Date: 1993-02-09 17:47:11 UTC
From: nmp@mfltd.co.uk
Message-ID: <1993Feb9.174711.25303@mfltd.co.uk>
Source record: 210451

It astounds me that there is so much discussion about what is essentially
a dead machine.
I have a 1040 ST, and its old, slow, clanky and I hate it.
When I bought it in 88, the Amiga (at least here in the UK) was getting
little support. All games it got were ST conversions. So I didn't get
an Amiga, and I couldn't afford a PC.
No sooner had I made said purchase than the tables turned. The Amiga
gained more support, ST support waned, and Atari utterly failed to
release a real competitor to fight back.
If I get another computer, it'll be a PC. Cos the equivalent to a 50MHz
486DX, 200MB HD SVGA display etc etc costs about 50% more if it is an Amiga
or ST. And the other point is most ST/Amiga games assume that the
user might have no hard disk (or in the case of the ST almost certainly have
no hard disk) - so you spend your life swapping floppies. Not only that
MOST games don't even notice if you've got 2 floppy disk drives. They
INSIST you use drive A:
Well fuck that. STs and Amigas are crap. I'll get a PC. And get FREE UNIX
for it.

Cheers,

2415. help for instaling emacs on my STe

Newsgroup: comp.sys.atari.st
Date: 1993-02-09 18:06:16 UTC
From: lperroto@ens-lyon.fr
Message-ID: <C270yH.AoH@ens-lyon.fr>
Source record: 210453

I tried to install emacs 18.57 that I got from ftp at wuarchive on my STe, and I get some troubles:

-> I use Gemini shell.
-> all is ok for the dump, I got an executable "emacs.ttp*", but when I run emacs, it says :

"emacs: Terminal type "atari" is not powerful enough to run emacs. It lacks the ability to position the cursor."

-> I tried all the TERMCAP file possible entries, vt52, atari, atari32, s0, s1, ...
=> same result.

-> I look into the TERMCAP file, ir does describe the vt52 command to position th e cursor in the x,y position on the screen.

Did someone install the same emacs ? How did it work ? what is your TERMCAP file ?
where can i get directly the executable (perhaps mine is not well-dumped) ?

Could you email me, please, as I dont read the newsgroup regularly.
All help appreciated, thanks in advance.

2416. FALCON030 Memory Survey

Newsgroup: comp.sys.atari.st
Date: 1993-02-09 18:06:37 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1l8rrdINNpqd@usenet.INS.CWRU.Edu>
Source record: 210454

Hi, I frequently write for Z*Net and would like to eventually do an article
on what people feel the memory configurations should be for the
Falcon030.

The Falcon030's present memory configurations is 1, 4, and 14 Megs of RAM.

My first question (not part of the survey) is will the Falcon030 only
recognize these configurations? If a memory board was added to the Falcon
that allowed 2 Megs to be used, would the computer recognize the 2 Megs?
Or will it only recognize 1, 4, and 14?

This is the survey.

Do you feel that a version of the Falcon030 should be sold WITHOUT memory?

Yes
No

What is the LOWEST amount of memory that you believe the Falcon030 should
be sold with from the choices below?

1 Meg ($799 suggested retail price)
4 Meg ($999 suggested retail price)

If 2 Meg was an option for the lowest amount of memory (costing a little more
than $799 (around $50), would you prefer it over the choice you made above?

Yes
No

Do you believe there should be a Falcon030 memory configuration between
4 Megs and 14 Megs?

Yes
No

If so, list the configuration that you would like to see:

What configuration (if these are the only ones available) would you purchase?

Falcon030 (1 meg)
Falcon030 (4 meg)
Falcon030 (4 meg/65 meg HD) (comes with Atari Works package and speedo)

Would the addition of the Atari Works package with the hard drive version
influence your decision?

Yes
No

Why did you answer the way you did?

What is your occupation?

Can you program computers?

THANK YOU!

Please reply e-mail so we do not clutter up this newsgroup.
aa399@cleveland.freenet.edu

If you're not extremely run into debt, get another MAC! Emulation on an Atari ST
works fine, but why take a copy if you can have the original?
No emulation can provide 100% compatibility.

Hope this helps.

Ludger.

The best solution certainly would be to open a second prompt window
where GNUPLOT commands can be typed in, but this might require major
changes in the GNUPLOT sources. I've been thinking about similar changes
a while ago.

>word accesses.

The 68030 in the Falcon just has a 16bit data path to the bus. Your
measurements must be wrong.

>seems that no Amigan wants to provide factual data to actually compare.

Start with telling facts.

2422. Re: How do u uncompress a '.Z' file using COMPRESS.TTP?

Newsgroup: comp.sys.atari.st
Date: 1993-02-09 20:10:36 UTC
From: phruby@ucrengr.ucr.edu
Message-ID: <25958@galaxy.ucr.edu>
Source record: 210460

My initial guess would be to use a "-d" or "-D" switch, as in:

COMPRESS.TTP -d FILE.Z

But I don't think this will work because the compress.ttp
file will only extract 13bit files. The UNIX system uses something else. I
remember seeing this before on this newsgroup. I seem to remember you had to
save it on the UNIX system as 13bit for the compress.ttp to uncompress it.
Does anyone one remember?

>experience slight, but VERY NOTICEABLE hesitations when looping from the
>end of a track/sequence back to the beginning of that track/sequence.

Hmmm. I don't have this problem with KCS Omega. This is a very complex
and powerful program, so I'm not surprised that you are experiencing
some frustration when you jump right in. I still run across new
features from time to time, and I've been using various versions of it
for five years!

All the timing information in Track mode comes from the conductor track
(track 1), so make sure the DE event is properly aligned in this track.
If you convert from tracks to sequences and include a faulty conductor
track this problem will migrate to your sequences. The calculator
function can be very helpful with cleaning up event timing. You can
also display the conductor track in TIGER, which can help you
visually track down timing glitches.

Do you experience this hesitation when using Cue loops? If the Cue loop
timing is correct and regular loops have a hesitation I'd look very
carefully at your conductor track. Do you have a tempo or time
signature event stuck in there somewhere?

Are you sure the timing problem is at the end of your loop and not the
beginning?

If none of this helps you could send me a simple TRK file that has this
problem and I'll take a look at it.

If you have access to GEnie, the on-line Dr.T's support is great, and
there are quite a few experienced KCS users who are very knowledgable
and helpful. And make sure you've registered your copy of KCS Omega,
because version 5.0 is due out soon.

The current version of Warp 9 is version 3.75 not 3.65. a.a.u.e has patches up to version 3.73. I'll post the 3.74 patch and 3.75 patch later this week.

Paul

2425. Novice Alert!!! What _is_ a Falcon?

Newsgroup: comp.sys.atari.st
Date: 1993-02-09 22:17:30 UTC
From: schwartz@feh.scs.uiuc.edu
Message-ID: <C27CL6.F80@news.cso.uiuc.edu>
Source record: 210462

O.k., I'm not totally stupid -- I can tell that the Falcon is a recent offering
from Atari's, a 68030 based computer, etc., but I was wondering a few things:

What equipment is standard on a Falcon?
What equipment can be bought as an add-on?
TCP/IP networking hardware?
A/D, D/A i/o boards?

Are these computers available in the US?
For what price?
Who's a reputable dealer in this product?

Is there good software available?
OS?
MIDI?
Database?
Word Processing/Desktop Publishing?
Graphics/CAD/Drawing/Painting
Networking
UNIX?

Does the Falcon run software for the Atari 1040's, 520's, etc.?

I've asked a lot of questions. Maybe I should be reading a Falcon
FAQ. Is there one?

2430. new STM player for STE/TT

Newsgroup: comp.sys.atari.st
Date: 1993-02-09 23:59:08 UTC
From: craig@yonder.equinox.gen.nz
Message-ID: <H.ea.0nopwKIBLd2@yonder.equinox.gen.nz>
Source record: 210466

Last night I also sent a new STM player to a.a, i'm not too sure if
it was already there or not (I have no way of finding out, waste of money
getting the index!),

it's called 50play.lzh , it's done by the guy from Electronic Images (of the
SPX picture viewer fame).

It works on either the STE or TT and will play Sound Tracker Modules (.MOD
files) at 50KHz !!!
It doesn't have a pretty front end, in fact no graphics at all, just some
text sliders on the screen to adjust volume/tone etc... but who needs
that when you're getting great sound ay!

Craig.

Yes!

It's called "Hermes", and it's shareware. (Hmm, I really should try to save up a few $$$ to send Martin; he's pretty helpful and Hermes is great!)

I'm using Hermes 1.04 right now; rumour has it Hermes 1.10 will be out real soon now (hmm, kinda like the Atari Falcon030, but probably sooner).

Have you:

1) edited your nethack.cnf file appropriately?

2) tried putting nethack.ttp in your AUTO folder (and renaming it
nethack.prg)?

If you have "only" 2M, the binary will probably have to be completely
unpacked... If the file's been PFX-Pak'd, or compressed with any other
binary compressor, you'll have to unpack it and save it to disk. I doubt
you'd be able to run it from a floppy on a 2M system.

Hi there,

One of my friends is trying to sell me a Spectre (or something like that)
MAC Emulator, the price is intersting but I'd like to know, before to buy,
what are the programs (and games) running correctly under emulation.

For example MS-Word - SymCity - SymAnt - FrameMaker 3.0 - Finale ?

Thanx a lot!

Savino

Yes :-(, but in VGA 640x480(16 colors) the loss in performance is about 6%, in
'True Color' 320x240 it's about 15%.

2449. Re: A1200/4000 v. Falcon 030 FAQ

Newsgroup: comp.sys.atari.st
Date: 1993-02-10 10:21:16 UTC
From: elendir@inf.enst.fr
Message-ID: <1998@enst.enst.fr>
Source record: 210481

I m not sure whether all that makes sense. But there are some points which so far have remained obscure and that I would like to clarify :

1. The Falcon really has a separate 32-bit graphics bus. When you open a 4 Megs machine, for example, you may notice that Atari has used 8 chips of 1Mx4 DRAM, giving 32 bit bus, instead of 8 chips of 4Mx1. The contention is not on the bus, but on the RAM itself. That means, if the processor does a ROM access, the video chip can do a RAM access at the same time with no contention. This means also that, on the internal expansion board, you can add what you call *Fast RAM*. You can even design a cache like the one found in the MegaSTE.

2. Blitter is a 16-bit chip, and uses CPU bus. The sole improvement is the speed, now 16 MHz instead of 8.

Anyhow each machine has advantages and drawbacks. Now, the point I m considering is in the multiTOS and equivalent Workbench. There I am happy to have a 030 instead of an EC020 because of the MMU. Memory protection is straightforward with a 030, painful with a 020. The MMU means also that in the future, a real UNIX-like system could be written ?

(PS : All the infos above extracted from the official Atari Falcon Doc)

Vincent.

The old STs *NEVER* needed to be rebooted to change to a different resolution.
I've had one since 1987, one of the very first ones that had the OS on ROM,
no internal disk drive etc. This has never needed to be turned off to change
resolution. You've been reading too much propoganda.

Hi Folks!

A friend needs to port a self made network driver from Atari ST
(TOS1.04 .. 2.06) to the Falcon (TOS 4.01).
Where can he get information about the changed structure of the
GEMDOS traps and everything else (I don't know exactly where the problem
is, so I can only ask for general information about the internal
structure of the new TOS 4.01)

Is there any documentation available via ftp?

Any help appreciated.

Regards, Axel

The program tab_plot can save a .ps file; I tried it once and it seemed to work ok. Try looking for tabplot.zoo, maybe on sol, or stuttgart.

Source record: 210488

I don't want to start a flame war, but this definitely falls into the comp.sys.atari.st.advocacy newsgroup... pity it doesn't exist yet. (If you WANT to see it appear, follow up to the RFD: c.s.a.s.a message that appeared a while ago!)

Many months ago, when the release of the Atari Falcon030 was supposedly "just around the corner", Atari claimed that there were many big developers interested in the Falcon030, including many NeXT developers.

Since then, they have mentioned that Kodak is "supporting" the Falcon030. To me, this means that someone else has written a PhotoCD application for the ST/TT/Falcon030, and Kodak has given it the official stamp of approval; it's not like Kodak is going to port its PhotoCD tools (available for Mac/PC/unix) to the tiny userbase of Atari computers...

So, we have _one_ large company that is "supporting" (ie, allowing someone else to work on applications for) the Falcon030. Are there any others? Are there really any NeXT developers playing with the Falcon030? Or are we being snowballed again?

> to forget?

First, the 105 MB drive should be a 3.5" drive. Second, you
can connect the second drive to the internal controller; you'll
have to provide some cabling, a small hardware patch to the
controller board, and you may also need a larger power supply.
Third, you need special software that recognizes the second
drive. Only few such drivers and installation programs exist;
one of them is our CBHD/SED combo.

> Also: will this setup still work when I swap to 1040 for a Falcon?

The Falcon does not have an ACSI bus, so you're out of luck here 8-(

>recognize these configurations? If a memory board was added to the Falcon
>that allowed 2 Megs to be used, would the computer recognize the 2 Megs?
>Or will it only recognize 1, 4, and 14?

This is an interesting question since many people believe that 1Mb is too little memory, and 4Mb would push the price too high. I think most people would agree that 2Mb would be the best minimum (especially as this is what the A1200 has).
However, the memory is organised so that you can have a board containing either 1, 4 or 14Mb plugged into the single memory expansion socket, and these boards are of non-standard Atari design. As well as not allowing you 2Mb of memory, this means that if you start off with 1Mb and later decide to upgrade to 4 or 14Mb, you must throw your 1Mb board away as it is no good to you or anybody else.
This seems an ideal oppotunity for a 3rd party memory expansion system. Such a system would plug into the Atari memory slot and take either two Atari memory boards, or one Atari memory board and several SIMMs. Since presumably the memory controler can't handle configurations other than 1, 4 or 14Mb, other amounts of memory would need a software patch that told the memory controler that the next highest amount of memory was installed, but told GEMDOS how much memory was really available, preventing it from dishing out non-existant memory via malloc.
I am hoping that a more complex expansion system would be possible that allowed Amiga like 32-bit Fastram to be added, perhaps via the FPU socket. There was some discussion about this a while back, and somebody said this was being worked on (I'd be very interested in any news about it).

In the mean time, if you buy a Falcon, make sure you get at least 4Mb of memory. At least if you want to upgrade to 14Mb you can sell the 4Mb board to some hapless person who bought one with 1Mb of RAM.
Since no 1Mb systems have yet been sold, I hope it is not too late for Atari to redesign the Falcon to take 2Mb of RAM and make this the minimum.

>This is the survey.

Haven't we seen this before?

} 2. I run a shell - KSH but the files I create are not owned by 'clive' (ME!)
} how do I get around it?

The uid/gid bits of the minixfs filesystem are set by the uid/gid that
you *actually* are. If you aren't using the multi-user mint style, then
you'll find that you're set to uid 0 and gid 0 (ie: root/system). If
you want clive/users rather than root/system you'll have to set the uid
and gid using a program - I'm not aware of any program to do this, but
it's fairly simple. Look in the source for init (by S.Usher) to find
how it's done.

>Wrong conclusion. SFII has been out for a while, and has yet to sell a single
>Amiga. BTW, interesting that it's $70 on SNES, and less than $40 on the
>Amiga...

Re, SFII not selling amigas: That's probably because the base hardware for even the lowliest Amiga is 3x the cost of an SNES box and the version of SFII for the Amiga absolutely *sucks* when compared to the SNES version. (The Amiga version comes on, what, 4 disks to swap? Jeezus... Even on the A3000 the animation isn't nearly as good or fast as the SNES version w/ more colors. Not to mention the lack of any reasonable way to control a six button game w/ a one button joystick)

I own an SNES (apple) *and* an A3000 (orange), and I love both systems. So I don't have any axe to grind here... it's simply a fact.

As far as SFII selling Falcons, I do have to agree that it probably won't sell any of those either, seeing as how a complete SFII/SNES set up is only going to cost you ~$160. Even if the Falcon's version were better (unlikely, IMHO given the fact that its controller probably doesn't have enough buttons and the SNES versions graphics are _almost_ perfect anyway). You'd have to be very dedicated or very stupid to pay ~$500-$600 more for a slightly better SFII box, if that's all you want.

Plus Mortal Kombat will be out on the SNES, RSN. ;^)

Fortunately, both the Amigas and the Falcons can do much more than play arcade games (like play Black Crypt, for example ;^)

Date: 1993-02-10 14:44:30 UTC
From: wmtwen@rw8.urc.tue.nl
Message-ID: <7307@tuegate.tue.nl>
Source record: 210495

I downloaded this from the Atari Benelux bulletin board and thought
thast people on the net might also be interested in this, so here it is
the description of the AVR sample format.

A.V.R. PRO SERIES 16m

Appendix III

Sample Data Formats

Here is a brief description of the AVR Sample format

The first 128 Byte on an AVR sound file on diac contain a sound file
header. The first BYTE or WORD immediately following the header is the first
BYTE or WORD of the sound sample itself. The contents of the header are as
follows

OFFSET SIZE DESCRITPTION
(BYTES)
--- --- ---

0 - 3 4 4 BYTE ASCII CHARACTER I.D. CONTAINS '2BIT'

4 - 11 8 8 BYTE ASCII CHARACTER SAMPLE NAME
UNUSED BYTES PADDED WITH NULL ($00).

12 - 13 2 WORD = 0 FOR MONO $FFFF FOR STEREO SAMPLE

14 - 15 2 WORD = SAMPLE RESOLUTION $0008 (8 BIT)
$0010 (16 BIT)

16 - 17 2 WORD = $0000 UNSIGNED SAMPLE
WORD = $FFFF SIGNED SAMPLE

18 - 19 2 WORD = $0000 NON-LOOPING SAMPLE
WORD = $FFFF LOOPING SAMPLE

20 - 21 2 WORD = ASSIGNED MIDI NOTE / SPLIT
$FFFF = NO ASSIGNMENT (DEFAULT)
$FFxx = SINGLE KEY NOTE ASSIGNMENT
$LLHH = KEY SPLIT, TWO BYTES, NOTE LOW/NOTE HI

22 - 25 4 LONG = SAMPLE SPEED SPLIT INTO 1 BYTE & 3 BYTES
BYTE 22 = 0 TO 7 OR $FF
BYTE 23 - 25 = 3 BYTE SAMPLE FREQUENCY IN HERTZ

26 - 29 4 LONG LENGTH OF SAMPLE IN DATA BYTES OR WORDS

30 - 33 4 LONG FIRST LOOP POINT (OFFSET IN DATA WORDS)
FORCE $0000 IF UNUSED

34 - 37 4 LONG END LOOP POINT (OFFSET IN DATA WORDS)
FORCE TO SAMPLE LENGTH IF UNUSED

38 - 39 2 - DO NOT USE - RESERVED AREA - MIDI KEYBOARD SPLIT

40 - 41 2 - DO NOT USE - RESERVED AREA - SAMPLE COMPRESSION

42 - 43 2 - DO NOT USE - RESERVED AREA - FILL WITH $00

44 - 63 20 FILENAME EXTENSION. FILLED WITH $00 IF UNUSED

64 - 127 64 FREE AREA FOR DEFINITION BY USER. MAY HAVE ASCII
MESSAGE OR OTHER USER DEFINED DATA

128 - EOF -SAMPLE- Held in format described by header.

Appendix - Page 13

This format represents a useful header which can be used to describe not only 16 Bit samples, but has the flexibility built into it to cater for MONO/STEREO and 8, 12, 14, and 16 BIT data sizes. 2-BIT SYSTEMS recommend, that users DO NOT occupy the reserved space in the first 64 BYTES of the header, the last 64 BYTES have been provided for micellanous use and abuse.

If the user is developing software which uses the AVR format, please note the following :-

When reading samples
---

i) Always check for the first 4 BYTES of the sample file for '2BIT' before attempting to load in any sample from disc. If this header is found, then it can be assumed, that the smple is in AVR format, no matter what the file extension is. It is useful, though not important, to save AVR files out as XXXX.AVR.

ii) After having established that the sample is indeed an AVR file, load the 128 BYTE header into a seperate area of memory. Interpret this header before attempting to load the rest of the file. This is important for a number of reasons, the least of which is, that if a Stereo or 16 BIT sample were just about to be loaded, the load address for the sampl block should be made on a WORD boundary.

iii) Do not take anything for grated about the sample. Ensure, that all of the important parameters have been read and interpreted. E.G. SIGN status. If your program can only use BYTE EXCESS samples then ensure that the samples is not signed (and un-sign it if it is).

iv) When reading the FREQUENCY long word, mask off the top 8 BITS. These bits were used in ST REPLAY, PEPLAY PROFESSIONAL and the first version of the PRO-SERIES editors. This byte took the form of a value from 0 to 7

which was used to denote a fixed SYSTEM frequency (0 = 5 kHz, 7 = 48 kHz etc.). If this value is read as $FF, then the editor assumes that the sample frequency is not immediately compatible with the choice which the cartridge and EDITOR support.

When writing a file
---

i) ALWAYS wipe the eintrire header area with zero's when constructing a new header.

ii) ALWAYS force default values and never leave RUBBISH in areas unused by the program in question, remember, another program may look for DATA which is nonsense otherwise.

iii) If looping is not used within an sample, ALWAYS force the start loop to be zero and end loop to match the sample length.

iv) When writing the sample record frequency long word into the header, ensure that the default of $FF is placed into the top 8 BITS.

SIZES and POINTER OFFSETS

Please note the use of the phrase 'WORD size' when expressing the size of a sample or the offset of the loop pointers from the start of the sample. It is assumed that if the sample is an 8 BIT sample (or less), then the WORD size is BYTE. If the sample is greater that 8 BITS then the size is assumed to be a 16 BIT data WORD. Hence a 16 BIT file size of 10000 words would actually be 20000 BYTES in length. The value stored in the header should be 10000.

2468. Re: Graphics Questions (Technical).

Some corrections about the graphics of the A1200 follow (I would not mention the Falcon after this senctence):

|>
|> A few questions:
|>
|> Blitter: I have used the amiga blitter *extensively*, and it can cope with 3 sources
|> (A,B and C) and 1 destination (D). The source can be shifted by upto 15 bits. The
|> new A1200 now has a 64 bit bandwidth for all blitter operations. As the blitter is
|> possibly the most importaint item for games hardware, i would appretiate any
|> information regarding the Falcon blitter (i hear some bad rumours about barrel
|> shifters and limited blitter operations (ie <256)).

Remember the Amiga has sprites which are instantaneous- much faster than a blitter object. It had 8 sprites, 4 color, 16 bits wide,
with the AGA it has 8 sprites, 16 colors, 64 bits wide.

|>
|> Playfields: The old amiga used to able to have 2 seperate 3 bitplane playfiles, each
|> with hardware pixel scroll in any direction, the A1200 allows 3 seperate playfiles
|> or one 256 colour mode. What is the display hardware like on the falcon? The planes

The A1200 doesn't allows 3 separate playfields unless you are counting the sprites as a separate playfield. The A1200 dual-playfields are 4 bitplane (16 colors each).

|> dont have to be aligned every 256 bytes to they? I would like to hear about the

leo@dcs.warwick.ac.uk (Leo Hendry) writes:

>This is an interesting question since many people believe that 1Mb is too
>little memory, and 4Mb would push the price too high.

Obviously these people have never seen a FALCON or any other ATARI ST
running under MultiTOS. Because 2 Mb are really not enough in that case,
as you can't start any other programs...

I don't think 1Mb for the FALCON could be enough for anything. The only
interesting question would be: How to use 8Mb? :-)

>No emulation can provide 100% compatibility.

It was my impression that the guy who asked about the Atari was
kinda disenchanted by the idea of buying just another Mac. I can
understand that very well. If I recall things correctly, he said
that he used UN*X a lot, and I think therefore switching to Atari
would be a great idea for him.
An up-to-date Atari offers a GUI that is equivalent to the Mac's
GUI. But in addition to that, an alternate setup can be created
using MiNT, TosWin, GCC etc. that lets you use the Atari in a
semi-workstation like fashion. It seems to me that this
possibility could be quite attractive for an experienced UN*X
guy.
The Mac emulation (Spectre) istn't 100% compatible, sure, but it
works ok for most purposes. Presently, it doesn't run system 7 (I
think), but this is being worked on, as far as I know.

> them seperately ?

I save the first part of a uudecoded binary as file.uue. I save additional parts of a uudecoded binary as file.uab, file.uac, file.uad, etc.

The uudecode that I have at work starts up with 'uudecode file.uue'. When it gets to the end of the first part, it reads the "include file.uab" line and then starts up on file.uab. It will do this until it reaches the end of the last part.

Alternatively, you can append the parts (in order) and use a program which is regularly posted to alt.binaries.pictures (I believe that's the newsgroup, it's been a while since I've gotten anything from the alt hierarchy) called 'convert'.

After the file has been decoded, you will generally have a binary archive file, which you can transfer to your ST.

There is also a uudecode for the ST which works in a manner similar to the one I described for the uudecode I have at work. Check for it on the atari.archive.umich.edu. It should be in the Archivers directory.

As far as I understand it the fact that it might work is not the point
of Pascal. It is meant as a language for tuition. At least, it was.
What do you need Pascal for anyway?

I always run Turbo Pascal from Aladin the Mac Emulator. But 'always' is
not very often.

2475. I've got some Mac stuff for sale

Newsgroup: comp.sys.atari.st
Date: 1993-02-10 16:49:28 UTC
From: malay@sae.com
Message-ID: <1993Feb10.164928.28779@sae.com>
Source record: 210252

Maybe one of you GCR users might be interested in this:

I have a some MAC stuff for sale:

MAC Plus - 4MB Memory, Keyboard with numeric keypad, internal
800K Drive, mouse, SCSI Cable - just buy an external
SCSI Hard Drive, plug it in and go. I'll include
your choice of System 6.0.5, 6.0.7, 7.0.1 on 800K
disks. Very Clean, new power supply. $450 includes S/H

800K External Floppy - Made by "Cutting Edge" - $60 includes S/H

and now some broken stuff but can be repaired:

Connor 3040A 40MB Hard Drive - SCSI, formats, runs great for awhile
and then has a problem accessing data.
If you power it down for a while
and then reboot then it runs with
data lose until it heats up again;
however, it doesn't run hot. You
can have this fixed for a flat rate
of around 90 dollars.
- $50 includes S/H

Photon 40 Complete External Hard Drive - case, fan, power supply,
has a Miniscribe 3650 inside,
external SCSI ID Selector, two external
SCSI connectors. I don't know what
its problem is, but can be repaired
for a flat rate.
- $40 includes S/H

Does this problem only occur when you exit/enter a folder cause it sounds a
lot like the (harmless) Ghost virus which is spread widely amongst ST
users.
Check some of your disks to see if they contain a virus (probably boot
disk), especially the Ghost virus but there are other viruses which invert
the mouse movements (after copying a disk 5 times etc).

I use uud, a very small program that I got WAY... back in 1987 or so
when I got my first ST when I copied a dealer's entire set of 10 :-)
disks of PD shareware/software (Back before I was on the 'net). I was
able to compile it on our Ultrix machine here and it works great (Very
portable code).

All you have to do is cat ALL of the *.uaa etc. files together in
order and it'll create the binary. It even ignores message headers &
such. Can't remember who wrote it... Moshe Braner (sp?) ??

WHOA!!! Hold on there, Len. I think you meant to say that Dave Small's Mac emulator (the Spectre GCR) does not support Mac COLOR (yet). It most certainly _does_ emulate a mono Mac Plus and does it very well indeed. Sorry, I just don't want to give the original poster the wrong impression. And although it's just vaporware dreams at this point, I was delighted to see Dave publicly state that he is no longer saying "never" to the possibility of a Color capable GCR in the future.

>You will also find that the Atari Community is more ACTIVE than the

>more active because we NEED to be.

Very good point, Len. As most folks know, I also dabble in peecee's and Macs so I interact with users of those systems quite a lot too. The one thing that I have found time and time again is that the Atari community (aka, users and developers) are just more _fun_ than the other groups. I suppose it's because we are a much smaller group and tend to support one another more (not that you could tell that from THIS flame-infested net). IMHO, of course. :)

I have an Epson LQ800 and have tried various versions of Chuck's drivers since the first version was released some time ago. I have had no luck. I dumped the output to the printer in hex dump mode and have discovered the problem however. It seems that the driver is sending codes (ESC 3 x) which the Epson printers don't use (but I presume make sense on the Panasonic). I don't know what the fix is, but you might try poking around with ResEdit. It seems Charles included descriptions of some of his printer resources which control which codes are being sent to the printer. That might help. If I ever get a few minutes I intend to look into it myself (but my Hard Drive just crashed again - damn thing - so it may be a while).

>Only a true moron would use A1200 without FAST ram. I think Commodore
>made a major mistake not to put say 2 megs of Fast ram to the A1200
>in addition to the 2MB chip it already has.

Hey spudster! Watch who you're callin' a moron!

However, I agree with the need for fast ram in the A1200. I just haven't has the spare cash to get some. I think I'll save up and get that GVP A1230 card /w 4 Megs and an FPU.

For the Atari Folks who wanted to know about bus contention with the AGA chips:

At 320x200x8 (256 color) there is 0% bus contention. CPU and Custom chips have full access to the chipram bus. And of course the CPU has 100% access to the fast ram (if you have it).

At the high res-non-interlaced modes (640x480x8, for exapmple) the chip bus is 100% saturated and the CPU can only access chip ram during the vertical blank. But the CPU always has 100% access to fast ram, even when the chip bus is saturated.

Since the Amiga has so many modes at so many different resolutions, there of course will be different performace factors for each screen mode. For example you could do a 800x600x8 72Hz interlaced with the same performance as 640x480x8 non-interlaced.

It all depends on what you want to do.

2483. Re: FALCON030 Memory Survey

Newsgroup: comp.sys.atari.st
Date: 1993-02-10 18:49:10 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1lbin6INN2gv@usenet.INS.CWRU.Edu>
Source record: 210263

Before I respond to this message, I'd like to thank everyone very much
that have taken the time to complete the survey.

If you have not completed it yet, please do. I am finding out a lot
of interesting information that I plan to share with everyone
next week.

In a previous article, leo@dcs.warwick.ac.uk (Leo Hendry) says:

>In article <1l8rrdINNpqd@usenet.INS.CWRU.Edu> aa399@cleveland.Freenet.Edu (Len Stys)
writes:
>>
>>The Falcon030's present memory configurations is 1, 4, and 14 Megs of RAM.
>>
>>My first question (not part of the survey) is will the Falcon030 only
>>recognize these configurations? If a memory board was added to the Falcon
>>that allowed 2 Megs to be used, would the computer recognize the 2 Megs?
>>Or will it only recognize 1, 4, and 14?
>
>This is an interesting question since many people believe that 1Mb is too
>little memory, and 4Mb would push the price too high. I think most people
>would agree that 2Mb would be the best minimum (especially as this is what
>the A1200 has).
> However, the memory is organised so that you can have a board containing
>either 1, 4 or 14Mb plugged into the single memory expansion socket, and these
>boards are of non-standard Atari design. As well as not allowing you 2Mb of
>memory, this means that if you start off with 1Mb and later decide to upgrade
>to 4 or 14Mb, you must throw your 1Mb board away as it is no good to you or
>anybody else.

Ok, I have found out that a lot of people (including myself) do not
understand how the Falcon's memory system works. If someone that knows
(has one) could post info on it, it would greatly be appreciated.

Specifically, what are the memory boards available for the Falcon?

1Mb board, 4Mb board, 14 Mb board?

What type of chips do each use? Does the 1Mb board use a 1Mb chip?
Do the 4Mb boards use 1 Mb chips?

And how about the 14 Mb board? Do they use 4Mb chips?
(Yes, I know that 4x4=16).

Could a 4Mb board be designed so that only 1Mb comes with it, but the
user can purchase an additional 3Mb?

I understand that when you buy a 4Mb board, you have to get rid of
the 1Mb. This makes the 1Mb a garbage chip.

> This seems an ideal oppotunity for a 3rd party memory expansion system.
>Such a system would plug into the Atari memory slot and take either two Atari
>memory boards, or one Atari memory board and several SIMMs. Since presumably
>the memory controler can't handle configurations other than 1, 4 or 14Mb,
>other amounts of memory would need a software patch that told the memory
>controler that the next highest amount of memory was installed, but told
>GEMDOS how much memory was really available, preventing it from dishing out
>non-existant memory via malloc.

Now, does anyone know why Atari made the memory controler so that it
cannot handle anything but 1, 4, and 14Mb?

This doesn't sound like a very smart move. What if you need 8Mb and
do not want to spend the big $$$ for 14Mb?

> I am hoping that a more complex expansion system would be possible that
>allowed Amiga like 32-bit Fastram to be added, perhaps via the FPU socket.
>There was some discussion about this a while back, and somebody said this
>was being worked on (I'd be very interested in any news about it).

From what I understand, this would not be possible. Anyone?

>>This is the survey.
>
>Haven't we seen this before?

No, I don't think so.

>
>- Leo
>

Not turned off, but rebooted. I have used ST's.
--
Raist

Only a change from color to monochrome reboots the computer. It really jumps through a
vector that can be changed. Multisync software do this and do the change without a reboot.

> game with no graphics and no sound won't fit. How far away is it from fitting
> on a 1Mb system (with hard disk)?

You greatly underestimate the complexity of Nethack. Graphics and sound have nothing to do with it, it is the unusual sort of game where the actual code is spectacularly complex, and even with ascii graphics and no sound takes huge amounts of ram. Of course, the size of the binary is only a small part of the story, don't forget that the program probably mallocs a great deal of additional space. Nethack 3.0j binary was around 660K, and while actually running in memory probably barely fit in 1 meg. 3.1 is a great deal larger and more convoluted than 3.0, so I would say you haven't got a snowball's chance in h**l of running in 1 meg. :) Nethack isn't just a game, it's a way of life. :) It should be in the Guiness book of records. A testament both to the dev team and to the compiler that can actually build it.

>How many TT users are there?

>>All right. I'll start the Canadian count.
>>
>> 1

>I'll start the Dutch count.

> 1

>(note that this way of counting has the danger that more than one person
>can give him/herself the same number, but we'll have a minimum anyway)

To avoid the problem:

```
wait(dutch_count_free);
dutch_count = dutch_count + 1;
signal(dutch_count_free);
```

If no-one incremented before, I'm no. 2

ok, in the same spirit :-)

```
wait(norwegian_count_free);
norwegian_count += 1;
signal(norwegian_count_free);
```

Gee, I guess I'm the first Norwegian TT-user to report.

>
> christian

I have a question on SLIP - what exactly is it?/how do you make a SLIP connection? I've just downloaded the Hermes package, and while it seems interesting, I have that one part of the plan that needs being done - actually making a connection to the network so that I can try it out (the mail, news, etc). Is NET.TOS the SLIP handler of the ST side, or do I need some other file(s)?

At present, I would probably be running it in a Mupfel shell, though I wouldn't mind running it via TC shell in a TOSWIN window under MiNT (wouldn't be bad - background mail/news processing)...

Also, what arrangements would I need to make (if any) with the sysadmin of the system I'm dialing into to create a mail/news link? Could it be done without his intervention, or does he need to set something up specifically for me? For instance, how/when would my system and his connect to do the transfer of mail/news? Could I leave my system going say over the weekend and have it automatically be updated at certain time intervals, or would I physically have to create the connection each time? (I suppose I might be able to use Connect to do a script login, if it has some sort of "cron" feature to it)...

And of course, how would I tie in a FTP/TELNET option into this? I'm a bit of a novice when it comes to networking, so I'm learning from the net...

Anyways, any help would be appreciated. It would be cool to have my own site, so...

I thin 1 meg would be sufficient for a SINGLE-TASKING system - then
the Falcon would be like a suped-up STe. However, if someone wants
to use MultiTOS, then 1 meg probably won't cut it...

Not very interesting... You have any 6-trigger jouy-sticks/pads available?
People who play SFII know it's supposed to be played w/6 buttons. To get this
playability, people will pay what they think it's worth. 1 or 2 button play
gets just a little more than squat.

Thomas, for used Lynx cartridges, give BRE Software a try at 800-347-6760.
They have a free catalog available for the asking and buy/sell used Lynx
cartridges. As I recall they sold most Lynx carts for 19.95 and bought most
titles for around $10.00. Hope this helps.

2496. MiNT Control

Newsgroup: comp.sys.atari.st
Date: 1993-02-10 22:20:24 UTC
From: Jan_Willekens@p12.f202.n281.z2.fidonet
Message-ID: <2b797fbf@p12.f202.n281.z2.fidonet>
Source record: 210265

Hello All!

With the release of MultiTos not that far in the near future, we would like to present you a program we wrote to make life easier when using MultiTos. This program is called MiNT Control.

MiNT Control is a control accessory for MultiTos. It enables the user to access various functions provided by the operating system in an easy and comfortable manner. Let me list some of these functions present in the current beta version:

- All processes can be displayed, killed, halted, continued, their priorities can be changed and various amounts of information on a particular process can be listed. (eg. how much memory it consumes)
- Information on global system memory usage can be listed.
- Program flags can be changed. Supported are: fastload/TT Ram run/TT Ram malloc, private/global/super/readable and the shared text flag.
- The MultiTos config files (MiNT.CNF and GEM.CNF) and the system environment can be easily edited through the use of popup menus.
- Processes can be started through the use of a kind of batch files, which enables the user to run one or multiple processes with a given priority, maximum memory usage, environment, command line, default directory, etc. A comfortable full-GEM editor is implemented in the program.
- At startup, the processes running (eg. your Auto folder programs and accessories) can be given a certain priority through the use of a configuration file.

MiNT Control runs on (Mega) ST(E)'s, TT's and Falcon030's. It requires a minimum resolution of 640 x 200.

What we would like to hear from YOU are suggestions. While reading the list above, has a certain feature come to your mind which hasn't been listed? Tell us! If there is anything you want to see implemented (like process startup time scheduleing), please do let us know! We can think of lots of things, but don't want to overload the program with features. It's better to have a functional not so extensive program which people USE than to have a large program, loaded with exotic features which nobody uses, and which only consumes a lot of memory.

So give us your ideas!

Thanks in advance!

Send all your ideas, comments, illuminated enlightments to:

Here's a simple test... if it will run on a Mac Plus, it will (probably) run via a Spectre GCR. Of course, it will be a bit faster and on a larger screen but that's just a sacrifice you'll have to make. :) If it's a color only app or if it accesses hardware registers then it won't work. From your list, I can only confirm that MS Word (4.0?) works fine on the Spectre. Make sure you buy the Spectre _GCR_ and not the older Spectre 128 as only the GCR has the capability to read/write Mac format 800K disks.

To make it all a bit easier. I know most of the people that have TT's in
Norway...*heavy counting and thinking going on in main-brain*..... and
there's at least 14 TT's that I know of, and probably about 10
that I don't know of. So the norwegian count is approximatly 25 TT's!

(for keeping statistics corect: population in norway is little over 4.000.000)

While we'r at it: In sweeden they have sold at least 300 machines!

There is howewer internal statistics that exactly can tell how many TT's that
were sold worldwide. Try to ask Bob Brodie, he'll be the right guy ta answer

this (I guess:^)

In <C1zKJv.8L6@news.udel.edu> don@chopin.udel.edu (Donald R Lloyd) writes:

> And what's this about "Overscan is not accessible from the desktop"?

This simply means that there is no "Overscan" selection in the resolutions pop-up. The reason for this is that in overscan mode on VGA monitors, the overscan is simulated (because VGA monitors don't even pass the beam INTO the overscan area!) - ie. the logical screen is wider than the actual physically displayed screen. The trouble is, of course, that if a newbie user selected this, the desktop icons, and the menu bar would be in this "not actually visible" section!!!! So, while the option is available via the XBIOS call that sets the screen mode, it isn't presented to the users at the desktop level. Of course, a simple AUTO program could do the trick... but only people who knew what they were doing would use that. The desktop itself is perfectly capable of running in any mode you set it in.

A bit annoying for us experts... but a user-friendly choice by Atari.

2502. WANTED: Monochrome Monitor

Newsgroup: comp.sys.atari.st
Date: 1993-02-10 23:44:57 UTC
From: ladd@iftccu.ca.boeing.com
Message-ID: <15300001@iftccu.ca.boeing.com>
Source record: 210272

I am looking for either a SM124 or SM147 monochrome monitor in good working condition. Will pay up to $50.00 & shipping for one. Please e-mail if interested.

Thanks, Bob

> on a 1Mb system (with hard disk)?

After Warwick and I finish fiddling with it, it might have sound and
graphics, and definitely won't fit into 1M...

The number of monsters/items/etc, dungeon algorithms, character
classes, etc all serve to drive the size up.

It's as optimised as you can go, and you probably couldn't use
pc-relative addressing/etc... the data structures are too huge. I find
it hard to believe that there is a working PC version...

> work reliably at such excess settings).

I was just clairfying for the people that might've mistakenly thought a
packed version would work on a 1M machine...

> >You'll need at least 2M of RAM for a version with all the options left
> >in (the binary I built yesterday is about 1019k or so).
>
> Yes.
>
> Might be a good idea to strip the binary :-)

It's that big stripped.

There are a few extra k of features that I'll take out (like the mail
daemon; STs don't generally get email... unless someone can give me a
suggestion for getting it to work with Hermes), but you'll have to take
out something _big_ to get it to work on a 1M machine.

A good reason to upgrade to 2.5M!

2505. Printing with Spectre 128

Newsgroup: comp.sys.atari.st
Date: 1993-02-11 02:00:51 UTC
From: neilex@brt.deakin.edu.au
Message-ID: <1993Feb10.210052.8297@brt.deakin.edu.au>
Source record: 210276

Does anyone else use Spectre 128 with an Epson Printer?

I have been trying to get a good printout for a couple of days with no luck using Chucks printer driver version 1.0, but I'm getting a lot of strange characters, and line misfeeds. I'm running it out of the parallel port into an Epson LQ400.

If anyone has any ideas I'd appreciate hearing how I might fix this problem.

Thanks - Neil Wallace

The Dominion, a major national newspaper in New Zealand, runs an insert each week on Information Technology and general computer stuff.

A couple of weeks ago, they released a glowing review on the Falcon, and finished it by saying that the official word is that it will not be released in New Zealand.

One more nail in the coffin of Atari.

STOP ATARI BLOODY AUSTRALIA DISTRIBUTING IN NEW ZEALAND!
IF THAT'S THEIR ATTITUDE THEY CAN STICK THEIR DAMN COMPUTERS.

Or to put it another way - Why is it 40% cheaper to mail order an Atari from the USA (including all freight and customs charges) than to purchase one locally??????

Source record: 210430

For Sale ---

ICD Link Host Adaptor - Brand New -- $90

I just bought this thing a few weeks ago and then I figured out what was wrong with my ICD Plus Adaptor. Now I have two host adaptors and I need to get rid of one. The LINK works, I tested it, and is really nice to use. Its small, it gets its power from the drive and its basically the easiest plug-and-play adaptor to use. All the manuals, cables, and software you might need come with it. I also made a cable that will go between the Centronics plug of the LINK and the 50 pin plug on most drives. I will through the cable in with the adaptor.

I would like to sell this little guy or trade it. I will take either a mono monitor in trade or something like a CMI accelerator board. Make me an offer and I will consider it.

Ciao,
Michail Gomberg

>--
>Raist

The ST never really has to be rebooted to change the resolution. As a simple demonstration, time how long it takes for the computer to switch from medium to low resolution as opposed to the original time it takes to boot when you turn it on. You'll notice that in changing resolutions, it doesn't have to reload the accessories. It's just that GEM itself needs to be reset for the new resolution. If you have TOS 2.06, I believe this can be accomplished by pressing "1" or "CTRL-1" , where 1 means low resolution, as an example. The computer will usually be back in almost no time at all -- this is _not_ a reboot.

Just for comparison, why doesn't someone elaborate on the process of switching from 640x480x16 to 640x480x256 in MicroSoft Windows? Can you say _blech_??? I don't think the Atari is worse of when it comes to resolution handling...

I guess you must not have actually read anything I've ever posted
(since I can't speak for Dave Baggett)

Let's try one more time...

I'm posting this with my venerable old 520ST... I use my ST more
than any of my other computers put together. I love my ST as
much as the most psychotic Atari Cheerleader...

However... I'm just totally embarassed by the PARENTS of my]
favorite computer.

It's as if the Tramiel family, one sunny Sunnyvale day suddenly
decided to lock the ST into a dark closet and not let it ever
see the light of day again...

The COMPUTER is great... why doesn't the COMPANY which makes
it feel the same...?

When you say "Anti-Atari", you have to be careful to
differentiate between not liking the computer, and not liking the
company which makes the computer...

Note that I didn't say I knew this to be the case, but previous Atari memory controllers have been limited to a few memory configs (3 in the case of the ST, although at least there were two banks of memory), and I would have thought they would make 2 and 8Mb boards if the memory controler could handle them.

> I do know that there is *heavy* bus contention @ 1280x400 in 8 bitplanes,
>specially in overscan, although I don't know what is the slowdown.

There must be some bus contention on the 640x400 256 colors on the A1200
since the review in BYTE stated that the 256 mode was slow on the A4000
and the A1200 only got a EC020. Why has German CBM-mags stated that there
is almost no prosessor time left when running the 640x400 256 color mode?
Why has a lot of software developers for the A1200 stated that they won't
use more than 320x200/256-mode because the system wasn't fast enough for
anything else.

Why is the A1200 faster than the Falcon since Jeff minter has made a
horizontal shoot'em up with 10 paralax scrolling in 256 color per scanline.
With pounding 16-bit sound and effects in the background without using the
DSP?

>So no bus contention occurs for the
Falcon in Monochrome, big deal, neither>on the old Amigas. Now, you got a
point, we have to do some benchmarking>with the A1200. Well, let's see when
I get one at the end of this month,>I'll do some C tests if I get a compiler.

Looks like there is an enormous amount of software for the A1200 since it
will take a month to get a compiler;)

>of the above are *true*.......NOT

The videobus and CPU is in a way shared, but the multiplexer runs
at 32 MHZ therefore it's twice as fast as the CPU so it will not slow down
the CPU. You can get fast-ram for the FALCON too SO WHATS YOUR POINT.

The A1200 has not got fast-ram it only has chip-ram which is a lot slower.
Fast-ram must be bougt in addition.

If you have followed this thread before you would have read that George
Robbins, a member of the A1200 development team, has stated that the Falcon
030 is a bit faster than the A1200.

What's the deal here? Where are all the A1200 owners that should be out
>|> there? How long has the A1200 been available for sale now? Don't any of you

Wrong again. Haven't I just told you that it's got NO fast-ram only chip-ram.

>
>Any Ideas?

Hi!

The tcp/ip package "n890421.lzh" provides query of a domain-server.
The Enviromentvar "TERM" is now exported while telnetting.
But... no mailer included, fix pathnames (instead of Enviroment).

I don't know where to get a vt100-auto-folder-emulator-prg...
You may instead try to set the TERM on the host (telnetting to) to "vt52"
e.g. "set term=vt52"

You may get the tcp/ip packages via anonymous FTP from "ftp.tu-clausthal.de"
or via email from "mail-server@ftp.tu-clausthal.de"
/pub/atari/telecomm/tcpip/*

Hi!

There are two packages:
tcp/ip with slip (modem) - called ka9q, available via anonymous ftp
from "ftp.tu-clausthal.de" (139.174.2.10)
or via email "mail-server@ftp.tu-clausthal.de"
/pub/atari/telecomm/tcpip/*
tcp/ip with ethernet - available from TU Wien (sorry, couldn't find
the ftp-address right now).

Bye,
Wolfgang.

I have some trouble compiling nethack3.1 on my 4MB-ST:
At the first file I try to compile, monst.c, gcc stops with
the error message

monst.c:2541: virtual memory exhausted

I have removed all resident programs, so I have nearly the full
4MB free, but this error still shows up. What am I doing wrong?

>handler of the ST side, or do I need some other file(s)?

slip is serial line internet protocol and allows you to connect your st to
the internet... the hermes package is (as far as I know) quite different
as it is uucp. hermes allows you to get mail and news, slip gives you full
IP capabilities, like telnet and ftp...

There was no "fault" in the microcode -- the microcode simply wasn't intended
to save enough processor state to enable the instruction that caused the bus
error to be continued.

It wasn't just "one register" that wasn't saved -- if you look at the amount
of data saved when a bus error occurs on a 68000, and compare it to that
saved on the '010, there's a *huge* difference.

>Considering anything else,
>you have 'virtual memory' everywhere. See how your editor swaps memory
>in and out from disks...

Don't split hairs. VM in the conventional sense means swapping *code*
without the application being aware that the swap has taken place.

>a great deal of additional space.

It's not that much, really. Including malloced ram the program uses
somewhere around 1,1MB. Thus, the size of the binary actually is by
far the bigger part of the story. Even though, there is not much hope
for making the whole game run in 1MB as this would still mean having
to save 100 to 150K and you probably can't do that without leaving out
major features of the game.

>Nethack isn't just
>a game, it's a way of life. :) It should be in the Guiness book of records.

Sounds familiar. Here in England its cheaper to order PCs from the States
than buy 'em here. Also I believe release dates here (on Atari stuff) _may_
be later than in Germany and the States, though don't quote me.
Congratulations to all those readers who managed to hold their tempers and
not flame me for the original article. What I said I do mean (except for
the bit about hating the ST), but I deliberately worded the post in an
aggravating manner, just for the fun of seeing outraged responses :-)

Cheers,

While I would not say that Howard Chu is making a false statement (or
the guys who posted the results originally) I have concluded that I am
quite skeptic about those results too, and you don't need a Falcon to
prove it:

If you have a 16 Mhz 68030, what is the fastest instruction that the
68030 can execute that will read/store a longword and read/store a
word? If it is two cycles, you might be able to do it on the Falcon,
as a word access is two bytes, and running at 16Mhz will give you the
16 M byte /sec. So I am looking for a 68030 assembly book now, to
see if it can be done.

2540. number of TTs

Newsgroup: comp.sys.atari.st
Date: 1993-02-11 14:12:11 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <11FEB93.09121150@cc4.crl.aecl.ca>
Source record: 210322

I haven't checked back through my files but I think that I have sold 10 TTs myself. Nine in Ontario and one in new Brunswick. I was also involved in the sale of nearly 200 1040s and 1040STes and about a dozen MegaSTes. I have also sold about 40 Portfolios but only 3 LYNXs (there is not local advertising by Atari so no one is aware of the LYNX).

Altogether I have sold 0 FALCONS; still don't know when I'll get any!

With floppies it's not a question of "interleave" but of "offset".
The two characteristics have similar reasoning but are quite different.

>performed equally well during writing, but BOTH of the Atari-formatted disks
>took significantly less time when READING. This is important, since your
>computer generally reads more stuff than it writes.

The read time will be affected by the offset and whether the
offset is properly matched to the seek time. But for formatting, you
don't seem to realize something. DCFormat (and some other formatters)
don't verify. I wouldn't really want to use a formatter that doesn't
verify. Bad disks are actually pretty rare, but it happens. For 3.5"

floppies, which I've been using since I bought my 1040ST (just a little while after the 1040ST was first on the market). I've only had about 20-30 floppies that were either bad "out-of-the-box" or that went bad after some use. That's maybe around 1% of my floppies. But a I don't need the headaches of finding out I have a bad disk by losing important work.

|> use more than 320x200/256-mode because the system wasn't fast enough for
|> anything else.

What developers said that?

|>
|> Why is the A1200 faster than the Falcon since Jeff minter has made a
|> horizontal shoot'em up with 10 paralax scrolling in 256 color per scanline.
|> With pounding 16-bit sound and effects in the background without using the
|> DSP?

This:

1. Doesn't prove that the A1200 can't be faster, since it doesn't
necessarily means that a game can't be developed on the A1200.
2. How do you know they are not using the DSP.

3. The amiga 1200, for a shoot 'em up game should be *much* faster
than the Falcon thanks to its 8 sprites of 64 bit width and 16 colors.

|>
|> >So no bus contention occurs for the

I am talking about buying an A1200. I have to save the money. If you give
me the $570 (US), I can buy it this weekend and receive a free copy of
DPAINT IV AGA and Final Copy 1.3. I guess you can't send me money to buy
the Falcon here, there's no one around ;-)

|> at 32 MHZ therefore it's twice as fast as the CPU so it will not slow down
^^^^^^^^^^^^^^^^^^^^^^^^
|> the CPU. You can get fast-ram for the FALCON too SO WHATS YOUR POINT.
^^^^^^^^
False. David Small said there was bus contention in modes like 640x480 256 colors.
It slows down the CPU. And you say the Falcon can get the Fast Ram, where?
In the dedicated expansion bus? Could be. Are those expansions readily available?

|>
|> The A1200 has not got fast-ram it only has chip-ram which is a lot slower.
|> Fast-ram must be bougt in addition.

True, but there are options in the market already. I plan to buy GVP's
1230+ Turbo, a 68EC030 @ 40Mhz with FPU, 1 meg of 60 ns ram expandable to
32 megs of ram. It's being shipped now.

|>
|> If you have followed this thread before you would have read that George
|> Robbins, a member of the A1200 development team, has stated that the Falcon
|> 030 is a bit faster than the A1200.

What did he say and where... If I recall correctly, I know of someone who
said that the A1200 could also be hit by bus contention problems as the Falcon.
Not that the Falcon was faster.

|>
|> What's the deal here? Where are all the A1200 owners that should be out

|> > And yes, since the A1200 has fast ram, it's faster than yours. Input
|> >/output to and from the computer should be the exception, where the Falcon
|> >seems to be faster.
|>
|> Wrong again. Haven't I just told you that it's got NO fast-ram only chip-ram.

OK, I said it wrong. I know it has no fast ram. What I wanted to say is
that the A1200 provides for a Fast Ram bus.

Not many will buy the Falcon for MIDI - they'll by Mac or PC. Not many will buy the Falcon for DTV - they'll buy Amiga or Mac. Not many will buy the Falcon for WP, DTP, 3D-modelling, etc. Atari is out.

Alright, you're gonna have one or two games by Jeff Minter, but that's not enough for me to switch computer...

2546. New Atari hardware?

Newsgroup: comp.sys.atari.st
Date: 1993-02-11 14:48:03 UTC
From: lmcstst@noah.ericsson.se
Message-ID: <1993Feb11.144803.7105@exu.ericsson.se>
Source record: 210300

Hi,

five years ago when I lived in the UK. I had a Atari ST at home, a
truly unique and innovative machine for its time. I am now in the market
for a home computer. As I hate PCs and SUNs are a bit expensive
(although the classic is mighty tempting) I am wondering what new
hardware Atari have come up with in the last five years?
PCs have gone from < 1mip to >50mips, any 50mip Ataris?

I would appreciate a list of current Atari computers specs and prices.

Thanks in advance

I don't know anything about "Chuck's printer driver" but there are a few good commercial and shareware printer drivers out there designed to let the Mac print to an Epson. Sheesh, I can't seem to remember the one I used to use but "MacPrint" comes to mind as one of the commercial packages. Ask in the Mac newsgroup for Epson printer drivers if you don't get any more help here.

Your article/letter follows:
Newsgroups: comp.sys.atari.st
Subject: Falcons in the US!

Guess what! Our local dealer (Xanth Computers in Bellevue, WA), just got
two demonstration Falcons! I went to see them yesterday (for some reason
they only had one displayed). It was pretty cool. Definitely a VGA
monitor is the way to go; the best they can do on a SC1224 (that I could
see) was ST medium with 256 colors and 320 X 200 true color. Interlace
didn't work. The 3D gadgets looked kinda funny in that low res. The
internal speaker sounded pretty good, but I wish they had it plugged into
a decent stereo system... MultiTOS seemed to crash all the time. I think
it was because of the OLD versions of STalker and STeno that they for some
reason had constantly loaded. I tried GEMview and that worked great...
It seemed pretty slow with GEM graphics... of course they had no Warp9 or
anything... I wanted to install a Minix partition on it to see if
MultiTOS could handle the long filenames in the directory windows, but
they wouldn't let me :(. I was pretty impressed all in all, but I wish
they'd have displayed it better (with a VGA monitor and stereo system,
etc.)

A 1Mb Falcon makes sense only for those searching for the absolute lowest entry level price. It's also good for Atari as they can advertise the Falcon "as low as $xxx." Please forgive my faux pas of "advertise" and "Atari" being used in the same sentence. :)

As long as MTOS will be disk based and hence, a RAM hog, a 2Mb Falcon would be worthless. A 4Mb system running MTOS would be the bare minimum if you want to do any multi-tasking at all, IMHO. An 8Mb config would have been a nice intermediate step between 4 and 14, however. Unfortunately, according to Atari there was just not enough room inside the cramped case to use industry standard SIMMs. Third party vendors, to include Zubair (maker of the Z-Ram board for ST's), are developing Falcon memory boards but I do not know what configurations they will support.

m>I'll admit that one slipped by me.. Maybe you're talking about the blitter
m>having 32-bit access to memory?? I don't know of any 'general' 32-bit
m>graphics
m>bus in the Falcon - video is part of standard RAM, which has a 16-bit
m>interface
m>to the CPU. So, you can move little bits of the screen around quickly, but
m>to fill a screen would take some time..

Sorry, but you're wrong. The memory data bus has a width of 32 bits (not only 16), but the data bus between the CPU and the ComBel has the 16 bit limit. This doesn't means that the CPU is two times slower than using a 32 bit data bus!

Bye,
Rob

This is correct. You can change video modes on the Falcon by selecting the
"Video Modes..." drop down menu and making your choice. This resets the GEM
desktop but does not perform a reboot. If you switch monitors, of course
(like from a VGA to an SC1224), then a reboot would be necessary.

Just some easy to follow advice:

Please, when you post on the NET, write you letters in 80 columns. It is difficult to read what you post in 85 or 90 column mode. Most of us read in 80 column mode because it is easier on the eyes. To set the terminal to 132 for one or two posts is worthless.

Thanks and now on with the show...

Hi,

I am not sure, if I will be able to go there, though I would really like to do so. Anyways, I guess, it would be a good idea, if some kind of meeting place for all InterNet-users could be agreed on --- I would suggest something along the lines of, every day at 12:00 anybody, who is interested in meeting those people he has been talking to by mail/news for years, should come to the entrance of the Atari press lounge.

Feel free to discuss this idea or come up with something more useful than this... :-) (Maybe, somebody could volunteer to keep a list of all InterNet-users who are going to come to CeBit...)

Markus

In article <runehy.56.729421323@dhhalden.no>, RUNE HYLDMO (runehy@dhhalden.no) wrote:
: There must be some bus contention on the 640x400 256 colors on the A1200
: since the review in BYTE stated that the 256 mode was slow on the A4000
: and the A1200 only got a EC020. Why has German CBM-mags stated that there

There is. On the A1200 or A4000, in non-interlaced 640x400, there is
100% contention--you get access to ram only on vertical blank times.

: is almost no prosessor time left when running the 640x400 256 color mode?
: Why has a lot of software developers for the A1200 stated that they won't
: use more than 320x200/256-mode because the system wasn't fast enough for
: anything else.

1) They haven't said that. I'd love you to prove me wrong. You can't.

2) 320x200x8 has zero contention.

: Why is the A1200 faster than the Falcon since Jeff minter has made a
: horizontal shoot'em up with 10 paralax scrolling in 256 color per scanline.
: With pounding 16-bit sound and effects in the background without using the
: DSP?

Because it's not hard. It's been done. Do note, however, that there
WILL be a speed difference between the 1200 and Falcon--with the Falcon,
you're allowed to hit hardware, and with the AGA chipset, if you want
graphics, you MUST use the OS. That alone will give the falcon an
advantage.

: Looks like there is an enormous amount of software for the A1200 since it
: will take a month to get a compiler;)

Compilers, of course, exist now.

: The videobus and CPU is in a way shared, but the multiplexer runs
: at 32 MHZ therefore it's twice as fast as the CPU so it will not slow down
: the CPU. You can get fast-ram for the FALCON too SO WHATS YOUR POINT.

1) Does or does not the 030 have 16-bit access to the memory? If so,
that cuts your possible bandwidth by 50%. Even with the limited
bandwidth available to the Amiga (heh), the bandwidth available is a
full-32 bit data path. That's on the 3000, the 4000 _AND_ the 1200. And
the 3000 didn't even have AGA.

2) Do you have burst access to ram? For the falcon, that answer is no.
For the Amiga, it's only true in "fast" ram, which is a fancy term for
ram which isn't "arbitrated" by the chipset, and "belongs" to the CPU.

3) How fast _IS_ that ram? What is the access speed? How much bandwidth
is available to the CPU? I believe that on the Amiga, the maximum
bandwidth any processor can have to ram is 7 megabytes/second, due to the
chipset's "ownership". At some point, that begins to go down due to
"contention". (and if you're going to say 16mb/s, youd better also tell
me the type of ram and the layout of it. If you're going to say
something realistic, on the other hand...)

: The A1200 has not got fast-ram it only has chip-ram which is a lot slower.
: Fast-ram must be bougt in addition.

The Amiga architecture at least has "allowances" for fast-ram where the
CPU can access the ram at the full speed allowable by the processor and
memory architecture--and that includes burst access. While the 020 has
no burst, the 030 and 040 certainly do.

: If you have followed this thread before you would have read that George
: Robbins, a member of the A1200 development team, has stated that the Falcon
: 030 is a bit faster than the A1200.

I was here, and while he did say something about the theoretical speed of
the Falcon, I remember no such statement.

: Wrong again. Haven't I just told you that it's got NO fast-ram only chip-ram.

The Amiga's architecture allows for fast ram. The 1200 can HAVE fast
ram. The Falcon's architecture, if I remember correctly, disallows
it--ALL ram is accessible by the "chipset", and that means that all of it
has limited bandwidth and no burst.

ok, I know this isn't exactly the correct topic for here but I have a question
and I figured you guys were probably the ones that would know the answer
better than anyone else.

I was finding my selkf rather bored playing Wing Commander II the other day
and I relaized that I use to have fun playing video games. So, I went out
and tracked down an Atari 7800.

Ahhh.. joy again! I can't tell you how much I missed atari. Anyways I have
about 8 cartridges for it. Now I know they made more. (specifically I'm
looking for desert flyer and asteriods) Does anyone have any idea where I
might beable to *gasp* order them? I saw Super heuy in a Kay Bee the other
day which I think it was next to their last cart for the 7800 but they
said it was their last one and they had no clue how to get more. (I
actually think tyhe last releases were Double Dragon and Rampage but I'm not
sure)

Its strange to see my sega genesis moved a side for the 7800 and my 486 getting
little use.. oh well..
Anyways, its been since 1988 since I've seen the system on the selves so
I figured its going to be next to impossible to find anything for it.

So, if someone who knows where I can order the things, please post the name
and/or number of said place. Thanks

Rob Merritt

PS. Sorry for interupiting the ST confrance.

>How the do you know whats facts have you tried a Falcon 030. Howard Chu has.
>Maybe he knows a bit better than you whats facts and whats not.
>

Well, lets think about this a bit. The Falcon runs a 68030 at 16 MHz on
a 16 bit data bus. Now, lets assume a memory configuration capable of running
the best it can under these circumstances: 3 clock asynchronous memory
accesses. Now, for a 16 bit bus, a longword access will take at a minimum
6 clocks (2 accesses need to be done to transfer 32 bits). At 16 MHz, this
works out to 375ns per access. Now, with this type of timing, you can get at
a maximum 2.67 million of these accesses, and with each access moving 4 bytes,
this works out to about 10.67 million bytes per second, or about 10.17 MB/sec.
Not the 32 MB/sec transfer rate given above at all.
Now, all of this assumes that no bus contention takes place, that the
memory subsystem is indeed capable of handling 3 clock memory cycles. Note
that cache issues are not brought into play here, as we are discussing bus
transfer efficiency.

I have been addicted to my Atari since purchasing it nearly
two years ago now. I use it mainly for C-Lab Notator and DTP,
however, I would like to find some PD software to aid in
titling my home videos, etc.

My search so far has been fruitless. I know of one commercial
^^^
product only, and can't find anything PD. Has anyone seen or
used a PD product available from any of the mail-server sites?

If anyone is looking for ideas to come up with new software, this
seems to be a relatively untapped area.

BTW, I use a 1040STe, 4meg, TOS 1.62 if this makes any difference to
your recommendation.

Thanks, all!

Hunh. I know someone running MTOS on a 2.5 Mg STE and they have no problems.
I think it depends more on what you want to do, and what you are running.
I was under the impression that MTOS took *less* space on the Falcons
than on a TT/STE as some of it was in ROM, thus it would take less
ROM on the Falcon, and maybe a 2MB machine might be usefull to run MTOS
for some people. (And some of it *is* in the ROMS. I've seen both
MTOS and TOSS 4 on the Falcons and they look similar. Since
the Falcon was *not* running MTOS, it was using it's ROMS to make for
the desktop AES. Since some of this is in MTOS, it shouldn't have to
be in the Falcon version of MTOS. Theoretically, the Falcon version
should be somewhat smaller.

I wouldn't knock a 1Mg Falcon either. There are plenty of people in the
Atari world still running on 1Mg (I am one, but might (soon ?) move up
to a 14M Falcon). I would hardly say those people would complain about
not having enough memory. Hell I would be glad to not have TOS 1.0!
(I'm not wasting *any* money to upgrade my machine. I'll either buy a
Falcon, or some other machine.)

Not to knock your statments (and I am guilty of the same thinking) not
everyone *needs* alot of memory/HD space. We all *want* it but we can
get by without it (sometimes quite comportably). Of course, once you
are spoiled, you just never want to go back :). (And I am *plenty*
spoiled, it just might be one reason my ol' ST doesn`t get much use
these days....)

Possibly you're doing nothing wrong. I never tried compiling on a 4 megabyte machine (I used a TT with more memory) and it's possible that gcc just can't compile that file. You could try removing the -O option (monst.c is only data, so it can't be optimized anyway) and running gcc from a very small command line shell booted from your AUTO folder (i.e. just type "gcc -c monst.c". That way you save the memory occupied by the desktop and by make.

Regards,
Eric

Well, you thought wrong. I've been having fun hacking on my ST for
years -- the fact that Atari doesn't have a competitive machine NOW
doesn't change that.

2578. ADVOCACY: New Macs out - Falcon price obsolete?

Newsgroup: comp.sys.atari.st
Date: 1993-02-11 23:49:26 UTC
From: jonal@dhhalden.no
Message-ID: <jonal.141.729474565@dhhalden.no>
Source record: 210448

At last my newsreader is letting me post again (It's my fourth attempt to post this info...)

It's lifted from an online Mac "mag" called TIDBITS. Have a little peek just below...
...

LC III
Apple has finally broken their ban on using the number three in a machine name, a ban reportedly started when the Apple III flopped. I predict that the LC III will not suffer the Apple III's fate - it's basically a IIci in an LC case with its 25 MHz 68030 and full 32-bit data bus.

The LC III's expansion slots make sense for a cross between the now outdated LC/LC II and IIci, with a single NuBus slot (although the internal size limits the NuBus card length to 6.5 inches), an LC-type processor-direct slot, and a socket for a math coprocessor.

The LC III takes up to 36 MB via a new single 72-pin SIMM slot. Its internal video can do 256 colors, expandable to 32,768 with more VRAM. Interestingly, the LC III will include RAM disk software - presumably the same sort that comes with the PowerBooks. The price is pretty good at $1,379 for a 4/80 configuration with no monitor. After a long life in the Apple product line, the IIci will no longer be sold, so look for some major price cuts in the near future.

...

Of course it does not run GEM software nor does it have a DSP, but I've seen the 15bit display of the Mac and as I know the Falcon has that capability in interlace only which is virtually useless as a working mode, I'm starting to wonder if the Falcon pricing is competitive. Atari must stop "releasing" products with prices just to have them on the street 9 months late with the same price... And, Apple cuts their prices every 3 or 6 months - The Atari SLM605 has had the same price the last two years (at least here, but then again, it's almost impossible to get hold of one - when should the SCSI based SLM406 arrive again??).

I'm starting to get really tired of this. I *MIGHT* be devoured into the ranks of the mindless MacMen anytime soon...

2581. Spectre on Falcon

Newsgroup: comp.sys.atari.st
Date: 1993-02-12 00:13:02 UTC
From: wmagro@uiuc.edu
Message-ID: <C2B79r.ADx@news.cso.uiuc.edu>
Source record: 210347

People have noted that the GCR part of spectre won't work on a falcon. This is ok with me, since it can use 1.4 meg floppies (which are mfm, even on a mac).

David Small said that there is no reason there might not be an internal spectre for falcon. He has also hinted that the color roms will be supported someday (or at least he'll try).

What hasn't been answered is an obvious question. will the software be updated so that a current spectre cartridge will run on a falcon? If not, no falcon for me.

>The ST never really has to be rebooted to change the resolution.

Well, sort of. You couldn't switch between the monochrome hires and the color medres and lores modes even if you had a monitor that could handle all modes. The ST senses the type of monitor (i.e. monochrome or color) and will reboot when the sense line on the monitor connector changes. You could make an adapter for say a Multisync to display monochrome hires at 70Hz but if you want to go color the ST did reboot.

I agree that the Atari has problems. I was a staunch Mac user and I bought it with spectre as a cheap clone. I have been _very_ happy. What extra I got was much better games, and lots of fun things to explore. I really have a lot of fun with my ST, so I won't be ditching it soon.

As for the Free Unix, I agree. I ordered a 40MHz 386DX yesterday so I can play with it. I already know, however, that it cannot replace my atari.

From: UPS500@rhrz.uni-bonn.de
Message-ID: <16B73D7F.UPS500@rhrz.uni-bonn.de>
Source record: 210450

Hello all Atarians!

I have had this problem for quite some time, but I have not encountrered
a real solution to it yet.

I have tried out 1000&1 Kermit to work with an IBM-cms mainframe.
Nothing has done the job for me so far.

From there, my question: could someone send me an UUE of a Kermit
that he is sure will work fine on a CMS-machine?
PLEASE ONLY SEND KERMITS, THAT HAVE WORKED ON YOUR OWN MACHINE
WITH YOUR VERY OWN ATARI 1040 STF!!! - because if that's not the
case, I am sure to have tried out almost all the Kermits that don't
work for me.

Having a CVM-modem, any other hint that could get me going would
be rerceived thankfully.

Best regards to all,
Markus Schlegel

Beware of the BRE scam. They saw the carts are 19.95, but they charge ridiculous shipping. Two day priority mail would cost $2.90. Normal ups ground would be about a dollar. They sent mine UPS ground and charged $7 shipping. For the total of $27, I could have almost bought the _new_ copy of blue lightning at Babbages. Insist on realistic shipping.

From: millerm@CS.ColoState.EDU
Message-ID: <Feb12.015801.59780@yuma.ACNS.ColoState.EDU>
Source record: 210355

I got interested in peacebug (pbug1_04.zoo) on atari.archive, because it is listed as a debugger. When I looked at all the files in the package it looked like a large system. I tried the readme files to see what the program actually did (many of the filenames suggested the system did a lot more than just debugging). Unfortunately all the doc's were in German, and I don't know that language. Anyone know the features of this program? I wanted to find this kind of stuff out before I downloaded it to my ST. I want to know if it is worth getting.

>see if it can be done.

I tried to email you the code that I used, but it bounced. Some mail gateway at ibm.com said that rchland was not a valid destination host. Please send me a valid email address and I'll resend the timing code.

In the meantime, I was discussing the timing code with the author recently, I had some concerns that the program wasn't correctly accounting for the effect of the 68030 data cache. However, upon further thought, with only 256 bytes of data cache and with the program accessing 2048 bytes per loop iteration, I am satisfied that the cache has been taken into account.

I do agree, the numbers appear too high to me. That was another reason to see how the code performed on another platform, as a reality check on my results. As for the fastest that a move instruction can execute on a 68030 - if both the instructions and the data are in the cache, there is no fetch delay so you can indeed execute an instruction in 2 cycles. Also, given the parallelism in the 68030 design, you can have one instruction executing with cached data at the same time that another instruction is causing a fetch from real memory, allowing overlap of execution. (But that shouldn't really affect the results of this test, which simply loops to read or write data as quickly as possible.)

>I'm starting to get really tired of this. I *MIGHT* be devoured into the
>ranks of the mindless MacMen anytime soon...

It's not bad to not lower your prices when they aren't that bad to begin
with. *BUT* in light of the new Mac prices and the price of those
486 behemoths (not to mention the slowly-being outdated 386's) the price
of the Falcon is not looking so spiffy these days.

Anyway, just for kicks, I'll pick on the LC III for awhile.

- Does't use standard SIMM slots (unless you own a NeXTStation Turbo)
This just means that every Tom Dick and Harry store won't have
the memory on Hand. But, since most people seem to order
memory mail-order you might just have to look around awhile first.

- Has there been a Mac (ever) that didn't break lots of software upon
release (like the ci,lc,si,cx,fx,quadra, etc) Hmm maybe the
Quadra 950, Classic, Classic II, LC II didn't cause massive
incompatibility problems, at that point, I ceased to care.

- I'd pick on the lackluster number of slots, but in comparison w/ the
Falcon, this seems pointless.

- I don't know about it's internal video, but the video on the LC, LC II
si, ci is certainly a CPU drain if an external card is not bought.
Believe me there is a world of difference. (The Falcon might suffer
from this as well, but all it will be compared to is the STE, TT,
and the Mega, so it should come out ok. Plus, the Falcon seems to
be designed to keep video rolling quickly...but we'll see).

- Apple has a little distribution problem right now. It seems they
can't make computers fast enough. Now, I *have* heard claims that
Mac stockpiled the new computers this time so there
wouldn't be a supply problem, but can you believe them. Some
people are mad as they are just getting machines ordered 3-6 mths
ago!!! You might be able to get a Falcon and an LC III at the
same time (but I wouldn't be on *either* Apple or Atari!!!).

Gosh, I'm disappointed, I thought I could dig harder than that. Well, it
does lack some things the falcon has. The Falcon has CD-quality stereo
sound input (LC III mono 8-bit 22 Khz sound input, but it *comes* with a
microphone, crappy though it may be). This might be a draw depending on
what you want to use it for. The mac sounds ok to me for sound-annotation.
It's better than you get over the telephone, which seems to be OK for speech.
(If asked I'll tell you about the Japaneese student who came into out lab
and wanted to run Kanji Talk....) The best thing for the mac is that
lots of programs have support for sound annotation on the Mac. Again, it
depends on what you want to do, and how high your standards are. The little
I saw of SAM on the Falcon convinced me it was usuable, whereas the Mac
sound players freeze the system till the sound is done. Some idiot I know
put a 2 min sound as his beep, and the mac did one of those common BEEP BEEP
BEEP things it always does and he was out of it for 6 minutes! I think the
state of the Mac-sound-thingy world is better now, but I really can't put
all those sounds on the Macs here in the lab, so I haven't kept up.

Of course the Mac games situation is a little bleek to (but it gets better
each month). I hear there is a *great* new CD-ROM game. But again, balance
what you want. Is there an Atari equivalent to Word + Excell (or even
the two #3's int the word processing/spreadsheet world?) I sure hope
Atari Works Works!!!

Hmmm. I came out more "pro-Mac" than I thought I would. Of course, *I*
still haven't decieded what I'm going to do with my money yet. (And I no
longer have a brand-new NeXTStation to shoot for!!!!) Well, the educational
prices for the LC III are do in tommorrow. Think I'll stroll over and find
out. If ya'll really care, I'll post. But I think we've had enough
of this silly bickering. If we didn't like Atari products we wouldn't
be here!!!

>: ram .... SO: dual prosessing!!!!!!

>What's all this about dual processing and it's own bus?
>Has the Falcon got dual ported VRAM or something?

No. The way it works (from what has slipped through discussion with Atari reps, devs, etc.) is that the Falcon has a seperate bus for the sound hardware and the DSP. In fact, I believe it is one of the sound DMA chips that acts as a 1MB/s (1MBit?) bridge between the main bus and the DSP's private bus. Sitting on this DSP bus is the DSP, 96KBytes (32Kwords) of RAM, and the DSP external connecter (I believe through some serial controller).
Sitting on the the main bus is the main memory, various and sundry support chips (serial controllers, SCSI-2 controlers, etc.), the DMA controler, and the interface hardware that pipes the memory bus's 32bit words over the 16bit CPU data lines. Not that the '030 has only 16bits usable, in fact it still addresses ROM, FPU, and possibly the DPS connector through 32-bits, but that is the "bottleneck" to main memory.

I was going to write this up in a separate post, but I guess I might as well put it here. I think I figured out how the Falcon gets such amazingly high throughput values.

The key is that we are talking about a computer whose CPU is running at 16MHz, but it is still running on 32-bit accesses. Since you have cut the bandwidth of your databus in half, but only access it at a relatively slow rate, then it shouldn't be a big deal to operate the bus between the CPU and the main memory at twice the CPU's operating rate to be completely transparent to the system. So operating a data-pump at 32MHz@16bits should clear any bottlneck.

Since the '030 operates using burst-mode filling of its caches when nibble-mode drams are used, it guarantees 4 (32bit) word accesses in 5 cycles. This is 16bytes/5cycles or 16bytes/312ns = 51.2MB/s max. Subtract 18.4MB/s for a 640x480x8bitx60Hz screen and you get ~32MB/s. Of course real-world values will be a bit less, like the CPU probably won't need to fill its caches every 5 cycles, and other things use the bus like DMA, floppy, serial, etc, not to mention video hardware may not use burst-filling. But then again, I believe Howard's quote of 32MB/s was for monochrome ST mode which is 640x400x2bitx72Hz = 4.6MB/s, which leaves around 14.5MB/s to be lost through non-optimal operating conditions and still give you around 32MB/s throughput.

Howard, or anyone else "in the know", care to correct this?

2592. Re: Swap joystick ports on TT-- can it be done?

I remember someone posting awhile about how they had used a multi-user version of MiNT to set up a multi-line BBS running on two ST's and a MegaST hooked together somehow (MIDI).

I have a friend who *really* wants to set up a multi-user BBS and since he has an ST (and is thinking of buying another, and maybe a Falcon for spice), I would really like some info on how to do so. No sense beating my head against the wall if someone has already done it!!!!

So if anyone has any info, please don't hesitate to stuff my mailbox!!!

2595. UNIXMODE and Minix Filesystem under MiNT

Newsgroup: comp.sys.atari.st
Date: 1993-02-12 04:30:50 UTC
From: lehmann@cs.tamu.edu
Message-ID: <1lf95qINN6u7@tamsun.tamu.edu>
Source record: 210361

This post has two topics that are related:

1) What must a user do to take advantage of the Minix filesystem?

I have been using the excellently designed "MiNT Distribution Kit"
with the GNU file utilities. I have been careful not to overwrite
these utilities with the akbin utilities.

Whenever I try to create any file with a file name greater than
8 characters, the name gets truncated by touch, elvis, jove, ls,
ln, sort, grep, and every other standard tool I have used.

Do I need to change some setting in MiNT.CNF to get the 32 character
filenames?

2) What utilites will allow me to backup data stored on a minix filesystem?
I currently have only floppy disks for backup. I am holding off buying
Diamond Back II becuase I believe that it won't back up my files.

Does anyone want me to write a guide for MiNT? Sort of a FAQ but with
extra details, like how to compile MiNT 0.99 using the MiNT Distribution
Kit (if that doesn't cause a conflict with the distribution notice). I
would make the guide similar to my "So, You want to install TeX on your
Atari ST guide." (By the way, I lost the entire guide twice. Once to
a hard drive crash, and the second time due to a hard drive crash and to
a 1 1/2 year son who took "bytes" out of the floppy backup. Only one
person expressed interest in the document after CS-TeX became widely
available, so I have discontinued the guide.)

I would like to collect suggestions being that I am fairly new to MiNT, but
experienced enough with AIX to be very comfortable with MiNT. Those of you
experts, please point me to good MiNT information or submit articles to
me. I promise to give credit to the authors and I even write a "good will"
contract to gaurantee that the author gets proper credit.

uh oh. What you describe sounds like a virus. I had this problem after
swapping disks with a friend (they now blame me for their virus problem) and
it took me 1 year before I realized it was a virus :-). You can get a virus
killer from FTP sites that will fix your problem for you. Make sure you check
all your disks with the virus killer.

Hope this helps,
Matthew.

>How the do you know whats facts have you tried a Falcon 030. Howard Chu has.
>Maybe he knows a bit better than you whats facts and whats not.

Well, in the meantime he could have discovered facts.

What he did was using a bus speed test program from someone else. This
program is quite inaccurate because it 'corrects' for instruction overhead
that does not exist on the 68030 which can move data and fetch/decode
instructions in parallel. The program gives rather 'real' numbers on 68000
systems though.

The result is an artificial high number printed as 'bus speed'.

>MultiTos. This program is called MiNT Control.

>MiNT Control is a control accessory for MultiTos.

I'd like to have the different functions implemented as CPX-Modules. This
way each user can decide which features to use and which not. Furthermore,
the memory for the programs is allocated at the time when it is first used,
and is not wasted.

What I don't like are huge accessories of which I only need a small part.

For me, a comfortable job control would the most important part of such
a program.

2602. Falcon Sighting in MA

Newsgroup: comp.sys.atari.st
Date: 1993-02-12 09:16:17 UTC
From: rost@tecrus.dec.com
Message-ID: <1993Feb12.141636.28747@ryn.mro4.dec.com>
Source record: 210345

Well, it finally happened. I saw a Falcon, in the flesh, running software. Maybe Atari really will be able to get some out to dealers. I just don't know if I would buy one.

The sighting was at my user's group meeting. A member of a nearby group happens to be a developer, had a Falcon and agreed to show it off. The box he had was a 14/65 configuration, and he demoed with both a SVGA monitor (looked like 14", didn't notice brand) and a 1224. He showed the bundled programs he had, namely the Calendar, Calculator, MTOS, Landmine. He had neither AtariWorks or D2D.

Yep, MTOS seemed to work although he didn't push it very hard. He pulled up Calamus and did some moving of a color image around the screen and it was satisfyingly quick. The interlacing needed for hi-res modes on the 1224 will drive you crazy in text-oriented apps. However, like the old STs, the mono tube will still only support ST hi-res, so if you're a mono person (like me) there is an SVGA in your future if you get a Falcon.

The most impressive demo was of a slide show in true color. This had some really nice animation effects and looked killer on the 1224, somewhat less impressive on the SVGA due to no ability to overscan (left a stupid white border on the bottom of the screen).

As a user of a twin floppy TOS 1.0 1040, this thing looked ridiculously fast and the much improved desktop was wonderful. Users who have upgraded their stuff to newer TOS revs, more memory, hard drives, etc. will likely be less impressed.

The biggest disappointment: the appearance. Psychologically, it's weird thinking of this thing as being more than a 1040. I recall a Mega STe demo I saw two years back and that machine *looked* impressive in its redesigned case and separate keyboard.

I'd have to say overall, the machine is impressive. It's still probably too expensive to capture much market share, especially now with the new lower priced Macs just announced.

2609. GNU zip v1.0.2 binaries available

Newsgroup: comp.sys.atari.st
Date: 1993-02-12 11:18:06 UTC
From: m91der@tdb.uu.se
Message-ID: <1993Feb12.111806.17229@tdb.uu.se>
Source record: 210319

Within a couple of days the binaries to GNU zip v1.0.2 will be downloadable from atari.archive as /atari/Gnustuff/Tos/Othergnu/gzip102st.zoo and from ftp.uni-kl.de as /pub/atari/archivers/gzip102st.zoo.

GNU zip is the successor of COMPRESS (and PACK). It gives you better compression-ratios in next to every case. It also eradicates the (in)famous problems imposed by COMPRESS when trying to depack files created on a big-memory computer with your 1MB Atari. Just to make the switch easy, the author also has put in routines that can decompress COMPRESSed and PACKed files.

The current version of GNU zip runs under a multitude of 'important' OSes (amiga, atari(!), msdos, os2, vms, unix and most of the *ix-clones). And since the author tries to comply with POSIX-guidelines it will probably be an easy task to port it to any other platform. The people behind the GNU-project seems determined to switch over to GNU zip RSN ((c) Atari ;-), and as far as I know the Linux-distribution already has been converted (reducing it from 30 to 23 disks).

Happy packing!

Not many will buy it for MIDI.. Gee, I guess all stribing musicians can afford a mac or a PC with a DSP board, and extra for MIDI-ports and a 16-direct to harddisk recorder/sampler. I guess no one will buy it for MIDI since BYTE-magazine wrote no negatively about it...NOT.. That's maybe why Atari representatives had their hands full receiving orders for it the hole night after it was voted "The best MIDI-product of 1992 at the NAMM-conference. The Atari has always done good in the MIDI market and will continue to do so, perhaps even better.

As for DTP, Atari has good products and better will come when they start using the DSP. The Atari has not got a big market in Europe, but has a stronghold in Germany, where I wish and think they will do even better and after a while maybe that stronghold will spread to at least the rest of Europe.

When it comes to the rest of the computer-areas you are probably right. Not many will buy it just to use it for 3D-modelling since the res. is to low. Not for WP either since it has not got Microsoft programs. As for DTV only time will tell. I agree that no professional studios etc. will buy the Falcon, they will buy Mac. Smaller firms will maybe buy Amiga since the Toaster and Scala is around, but the Falcon is also able to do the same if just someone develops hardware like the Toaster for it. Only time will tell.

As for games there will be alot of good games for it. As there will be for the A1200. Altough I belive the Falcon games will be a tad faster and

better. (Lucas Film is thinking of making X-Wing for the Falcon..with DSP effects?!) Again also here only time will tell.

Greetings from

Rune Hyldmo, anti sig.file activist

Gee, I actually wrote a follow-up without saying anything irritating. (well at least not very irritating, well maybe very irritating, but at least not very, very irritating, well maybe .....)

"Standard" is a relative term. The NeXT machines are not the only ones to use 72-pin DRAM SIMMs. The Amiga 4000 does, as do a number of DOS machines. Actually, the 72-pin SIMMs, with their 32-bit data bus interface, make a lot of sense if you think about it. You can upgrade your memory one SIMM at a time instead of by twos or fours as is the case with other SIMM types.

For the most part, software compatibility problems are caused by software vendors that don't follow the (by now, very well) established rules for Mac programming. True, occasionally Apple has done something wrong and has broken some software. But it's far and away more of a problem with the 3rd party software folks.

> be designed to keep video rolling quickly...but we'll see).

The internal video of the LC and LC II (and LC III,too, for that matter) does not slow down the machine. Your assertion is true for the IIsi and the IIci - they use a cycle-stealing DRAM-based frame buffer approach that negatively impacts CPU performance. The LCs, however, all have VRAM-based video hardware which does not exhibit this performance degradation.

>and tracked down an Atari 7800.
>
>Ahhh.. joy again! I can't tell you how much I missed atari.

[Off topic, sure, but better than Atari flames...]

I too bought a 7800 after purchasing a Genesis--and my Genesis hasn't
been touched in a long time. Some games I'd highly reccommend are:

Centipede
Joust
Robotron
Xevious
Mario Bros.
Asteroids (fancy--more like Blasteroids than the original)
Ballblazer (even better than the 800 version)
Food Fight

And some to avoid:

Crack'd
Karateka (very bad version of the Apple II classic)
Ninja Golf
Jinks

Officially, the 7800 stopped production in December 1991 and the
many of the last batch of cartridges are difficult to find: Scrapyard
Dog (now a Lynx game), Motor Psycho, Fatal Run, Basketbrawl (also a
Lynx game), Meltdown, and a few others. Most of these later games
aren't as solid and playable as earlier titles.

You can still order games from a couple of places. Telegames USA:

Telegames USA
Box 901 V
Lancaster, TX 75146
(send $1 for catalog)

has some games, but they are missing quite a few titles and are
a bit overpriced. Another place to try is Video Magic. They've
got a good selection of games, new & used, for $6-$8. A catalog
costs $2, but I don't have the address handy. Email me and I'll
dig it up.

Hah! So you mean that the Amiga couldn't be a MIDI-computer (like the ST)
if "someone develops" software like Cubase and Finale for it? That's the
same thing really.

> configuration with no monitor. After a long life in the Apple
> product line, the IIci will no longer be sold, so look for some
> major price cuts in the near future.

As a little hint at what the streetprices will be:
(excerpt from newsposting to the Mac area, // is my comments)

Here are the updated prices at the GTEch computer store :

LCIII 4/80 $1250

Ce610 4/80 $1595 //(25MHz EC040)

Q700 4/0 $2095 //(25MHz 040 - the real thing...Two months
ago you had to shell out 4 big ones for
it...)

The list also lists all the other models, but I think these will do... The
New 16MHz Color Classic goes for almost the same as a LCIII.

Any thoughts?

This is pretty strange logic? Why is it easier to put lharc archives inside
a zoo archive and writing an install program than doing the whole trees with
lharc, for example? I think the various Questor versions have allowed this
for a while. What does this have to do with ftp? Or binary mode?

> [There was no Unix lzh dearchiver for many systems.]

Huh? Who needs a unix lzh dearchiver? Do it on the ST? Isn't the idea
to get the whole binary file (or 8 files, in this case) on your computer? :)

> And CS didn't use zoo 2.1 because it didn't exist when he write his INSTALL
> tool. LHarc just packed better than zoo 2.01.

Fair enough. So now that zoo 2.1 has been available for what, a year or
something, why not do it over again? The install prg is nicely done
but unnecessary. I also don't like the way you HAVE to run the install
prg from floppies. (Though it does force you to have floppy backups, which
is probably a good idea, but in a non-optimal way).

So... a suggestion: make 8 zoo 2.1, complete tree archives, and put up
a small file, perhaps with zoo 2.1 in it, with a text file saying exactly
what options to give to zoo. This would also have the benefit of letting
us back up to floppy just 8 zoo files instead of a pile of lharc archives
and install programs. I would even do it, but I can't upload to a.a.

Source record: 210352

Newsgroups: comp.sys.atari.st
Subject: Software for the TT
Summary:
Followup-To: Article by 'Hutch'
Distribution: world
Organization: California Polytechnic State University, San Luis Obispo
Keywords:

I must apologizer Hutch, I did not mean to bring down all US developers
when I mentioned mediocre software. I will be more specific.
When it comes to software that I NEED TO USE, there is not much out there.
The software that I need to use includes mathematical programs, circuit
simulation programs, formulae graphing programs etc.
On the IBM or MACs there are several pieces of software from each group
mentioned above that you can choose from. This is what I meant.
Sorry if I offended any of the developers here in the US, because I do use
on a regular basis many programs from the US. However, when ATARI put
out their Intl. Software Cat. it had many programs in German or French
only that I would love to own.
Only if I spoke German......

BTW I am going to get off on another tangent....

How many of you people think that Bob Brodie is an idiot? I personally
do, the reason being is that I believe that he fails to realize that
ATARI is going to slip into nothingness unless a major marketing
campaign takes place with the falcon, (which I doubt will happen).
Another reason I feel that he is an idiot is because I met him at the
very well organized and nice GLENDALE ATARI SHOW in California, and he
treated people like they were stupid idiot jerks, in other words it
seemed as if he thought he was one step higher than everyone else. When
people asked questions of him he usually had some stupid personal story
to tell and then ended up acting as if the question asked of him was
something a retarded person would ask...
If he is in charge of anything important at ATARI woe for us.

Ahhh, I finally got that off my chest, now I'll probably be blackballed
though because all atari owners here in the US know each other on a
first name basis.

> mail.

The GNU compress (in Gnustuff/Tos/Compress/compress.zoo I think) would
be a better idea... it compresses/uncompresses 16-bits, and doesn't
bus-error (two bombs) when you say "compress *".

The compress and freeze that come with Hermes (1.04) bus-error if you
tell them to pack/unpack more than one file at a time. This is FINE for
use with Hermes, since it only packs/unpacks one file at a time; it's
inconvenient for "normal" use.

The password system in GODS is such that you cannot use
someone elses passwords. Each copy of the game creates different
passwords on disk 2. Therefore you will have to try some other options

CHEAT - There is one built in. You must enter a certain word in the password
screen, can't remember what it is off hand.
BORROW - Use a friends disk 2. It isn't copy protected and I don't believe
there is any copyright on this disk.

OK?

I'm looking for the demo (or maybe the shareware) version of OutBurst for
a friend. Is it available at any FTP sites around the net? Maybe someone
could mail it to me?

Thanks in advance.

Question: What is known about the Jaguar? Is it defently coming out or is it
vapor-hardware? (I read a mag artically 2 years ago saying it was made up)
If it is real, is it the dual 68000 system that I heard it was?

Rob Merritt

[lots of nonsense of Jeff Minter's game (so what?) and bogus "specs"
deleted].

Here are some facts (hopefully, any Amiga owner can correct me on these
if he wishes) for comparision. I'm not going to apply any judgement to
these facts. All I want is a comparible set of facts from an Atari
owner. No tilted spec lists with stuff based on speculation about the
numbers, JUST the numbers themselves ok? This is apparently what you
want Rune, and I'm going to give it to you (to the best of my
knowledge).

Very rough idea of bandwidth taken up (minus H/VBlank) with 8bitplanes.
If you reduce the bitplanes, it decreases, for example.. if you
use 4 bitplanes divide the percentages below by 2. Since the Amiga can
do a greatly varied combination of scan rates, the resolutions given
below are the typical ones, but not the only ones (by far :-)).

640 across at 31Khz (VGA) = 100%
320 across at 31Khz (VGA) = 50%
1280 across at 15Khz = 100%
640 across at 15Khz = 50%
320 across at 15Khz = 25%
800 across at 24[?]Khz (SVGA?) = ???%

The CPU needs 50% of the bandwidth to operate at full speed, so at bandwidths
taken up of 50% and below there is no CPU contention for chipram.

I hope the stats above are clear enough. Now I'd like to see a similar
list for the Falcon.

This is a given point to you. I knew that other computers used them, but
I thought it was a PS/2 or something. But it does mean that Apple owners
can't sell each other (and ST owners) used memory (unless they find some-
one else with a new mac (or one of those other machines). This means they
have to remember and learn more about their machine (not a bad thing).
I really wasn't condemming the choice apple made, just pointing out, that
for some, it will be a stickling point. All in all I think the new memory
is faster and since there are less of them, easier to deal with.

I don't know about the realative prices, but with all the new macs using the
memory and some dos machines, the price should drop steadily.

>the 3rd party software folks.

Huh...sorry but those machines broke *Apple* software. They are hardly a
third party develper. We could go into a long discourse upon the reasons
why those things won't happen again (I mean the 32-bit clean thing is
mostly solved (Execpt for Microsoft!! Word 5.1 ain't 32-bit clean!!!) and
I think the problems with the 040 have been cleaned up (but I still hear
grumbling on the net.) The real problem is that machines like the LCII and
the si should never have caused a problem, but software manufacturers made
and unreasonable assumption that 030 == FPU and that crashed machines.
Apple got socked in all these cases (Microsoft and some third party
manufacteres are not the only ones....). I still think that the Clasic II
ROMS aren't 32-bit clean. I don't know about the si and LC II (but I seem
to remember that they are not...). Anyone what to bet on the Centris

Models? I just bet some dopehead patching the 030=FPU code made a silly
assumption of 040=FPU (after all, it's *built in* he said. Hahahahaha).

>> - I don't know about it's internal video, but the video on the LC, LC II

>the IIci - they use a cycle-stealing DRAM-based frame buffer approach that
>negatively impacts CPU performance. The LCs, however, all have
>VRAM-based video hardware which does not exhibit this performance
>degradation.

Hmmm. I had thought that the LC and si had essentially the same video, and
I knew it slowed down the machine, so I made the assumption for the LC
family. Guess I was wrong...sorry. (My knowledge of Mac models that I
don't have to deal with *is* a bit sketchy). One of my friends points out
that they think apple is desparate for realasing a confusing number of
machine models. I admit, you do have to pay attention to remember the
subtle differences between all these beast, and what corner Apple cut
to save money.

Oh gosh. Here I go *spouting* off again! Gonna know enough about Macs
to hate Apple just as much as Atari!!

By the way Atari is *not* by *any* means the king of "Real Soon Now". I
think #1 goes to Microsoft and #2 goes to Apple!!!

2633. Printerdriver definition for 1Word+?

Newsgroup: comp.sys.atari.st
Date: 1993-02-12 21:38:19 UTC
From: leonp@cs.kun.nl
Message-ID: <C2Curv.HwH@sci.kun.nl>
Source record: 210369

Hello Atarians,

I very much need to know how I can write my own printer drivers for
First Word Plus (3.??). What I want to know in fact is if there
is a part of the printer driver that defines a initialisation sequence
for the printer. We have the normal First Word Plus manuals, but nothing
can be found in it about this.
Is there a document somewhere on the net describing the
First Word Plus printer drivers?
Can anybody help me with this?
I would furthermore be very pleased if somebody has a good
printer driver for the HP Deskjet 500 Printer (the original one
is not quite good enough for us).

Please respond by email, since I cannot read this newsgroup regularly at the
moment.

Thnx for any help,

Leon Pillich

2634. What is wrong with my 1040 STe?

Newsgroup: comp.sys.atari.st
Date: 1993-02-12 21:42:52 UTC
From: darkstar@u.pathology.washington.edu
Message-ID: <1lh5ksINNooe@shelley.u.washington.edu>
Source record: 210370
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have a 1040 STe with 2 megs. It has an intermittant problem: sometimes the display freezes, the keyboard does nothing, etc. When I turn in off and on again, or press the reset button, sometimes it reboots, and sometimes the screen stays completely dark. Sometimes it cures itself quickly (5 minutes), and sometimes it takes a day, and sometimes a trip to the Atari doctor, who can find nothing wrong.

We were told by one Atari doctor that this is caused by a chip working loose from its socket. I've tried taking the covers off and pressing the chips down - again, sometimes this works, sometimes not.

Can anyone suggest to me what might be causing this annoying problem, and how to alleviate it? It's driving me nuts. Replies by email please - thanks.

I'm having a little trouble downloading archives from the University of Michigan using *gopher*. Does anyone know of a way in which gopher can be safely used to download archives without them being corrupted in the process? Any help would be greatly appreciated.

I'd normally use FTP, but it's almost impossible to get a connection to UMICH and I'm just trying out different systems.

Thanks in advance,

> ago you had to shell out 4 big ones for
> it...)

Two quick corrections here: the Centris 610 uses a 68LC040 (the one without the FPU) not a 68EC040 (the one without either an FPU or MMU); and it runs at 20 MHz, not 25 MHz.

The new 20-some button controllers were shown on a set of Falcons at Comdex.
They plug into the (STe) analog ports. The Falcon developers docs includes
in the game development guidelines that all games should be written to use
these ports instead of the regular ST joystick/mouse ports.

>the Mega ST, the coprocessor is installed differently, and fairly
>incompatibly.

All of the co-processor add-ons I've seen are compatible with the Atari SFP004 specification, which is supported by the GCC library. In total, the GCC library implements floating point arithmetic 3 different ways - plain 68000 code, SFP004 compatible code, and native 68881 code (which is really only usable by 68020 or 68030-based systems).

Since it's now apparent that we can implement a Line-F emulator to allow any program to use the floating point instructions directly, the question now becomes - how do we specify things in the _FPU cookie? We need values that mean "no FPU, 68000 emulator installed" or "SFP and emulator installed" in addition to "no FPU code at all" and "FPU in coprocessor mode installed"...

>"Video Modes..." drop down menu and making your choice. This resets the GEM
>desktop but does not perform a reboot. If you switch monitors, of course
>(like from a VGA to an SC1224), then a reboot would be necessary.

Actually, I've switched monitors on the fly. The screen is really scrambled,
and the difference in frequency is probably pretty terrible for the monitors
themselves, but once you select a new mode in the Video Preferences menu
everything is adjusted for the current monitor, and you can pick up right
where you left off. (Obviously this is not something you want to do very
often. But if you must, the trick is to have the menu selection already
made, without pressing "OK" yet. After you switch monitors, it'd be well
nigh impossible to make enough sense out of the screen to mouse over correctly
to do it then...)

(lots of information deleted)
> Howard, or anyone else "in the know", care to correct this?

I believe Michael Elst has hit on the problem with the numbers I posted previously, the timing code subtracts the time to execute a dummy loop from the total execution time. On the 68030 since the instruction and data fetches are fully independent and can occur in parallel, that "overhead" really doesn't exist, (ok, there's a cache fill the first time thru the loop, but since all interrupts are disabled, the loop runs 100% in the instruction cache from then on, so there's a *tiny tiny* amount of overhead...) so the speeds reported are too high.

I'm still curious to see how the numbers for the A1200's 68EC020 compare, since it has an instruction cache and no data cache. (For this test, again with the loop running entirely in the instruction cache, the results should be directly comparable.)

In the meantime I'll try it again without the erroneous overhead computation...

Sounds nice, are you also going to fix the "bug" or whatever that
changes the background and border colors when nethack starts? It
annoys me very much, I like to play with black bordes and black
background. Also the colors are gone, even with the color option,
Nethack 3.0 pl10 had nice colors for different monsters, i liked that.

So, any way to fix this?

hyc@hanauma.jpl.nasa.gov (Howard Chu) writes:
>Say, how much does the phone company there charge for this service?

The average seems to be about $6.00 per month, where available. Various states are, as usual, balking at the new technology, but I think that that is only changing the order in which some states get the technology, since the phone companies can only phase it in so fast anyhow.

SM> I personally am sick of mediocre software put out by US companies
SM> (at least for
SM> what I need) when there is great software from ther countries but
SM> in different
SM> languages!

That's only the problem with German or French software, most of the other countries try to programm in English. It's very common to use English even when you're a Dutch programmer cause Dutch isn't that important to us.

But in Germany they want everything in their own language (as do the French), we have ofcourse the advantage that we can understand at least 80% of the German language.

From what I hear, Caller-ID penetration has grown much faster than expected, at least in Bell Canada territory. I wouldn't be surprised to hear the same from many other telcos.

For a product not yet introduced, I would DEFINATELY consider including it, or at least a way it can be added on.

I had caller-id before I moved, and it was $4.50/month, I think, for just the service. (I also rented a call-display phone)

Maybe ask on comp.dcom.telecom about market penetration.

2648. WARP 9 _Upgrade_ now at a.a.u.e

Newsgroup: comp.sys.atari.st
Date: 1993-02-13 03:21:12 UTC
From: dlk0ms9s@umiami.ir.miami.edu
Message-ID: <1993Feb12.222112.14498@umiami.ir.miami.edu>
Source record: 210385

WARP 9 Upgrade patches are now available on a.a.u.e. However you MUST have bersion 3.73 or 3.74 to use these. If you do not have them, you must write to CodeHead directly for upgrades.

If you have 3.73 you must get BOTH the W9 373->374 and 374->375.
If you have w(374m you only need 374->375.

These are PATCHES only! And if you don't have Warp 9, go buy it!

Hey guys!

Anyone heard of the vi-emulator that decodes JIS instructions to display Japanese Kanji/Kana??? SOMEONE's gotta know about this!! After all, it was _only_ designed on the ATARI ST!!!! I reeeely need to get my hands on this, as I can't seem to compile it on my Unix terminal at school (too many restrictions) Again, the name of the program is JSTEVIE (I don't really care what version....well actually, the newer the better!) If anyone could possibly get the newest one (the one that can translate new-Jis, shift-Jis and all-the-other-stuff-jis codes...) If anyone can help, Puleeeeeeeez do!

Wow! Here's a case where something designed on the ST has become the WORLD standard!! (A whooooooole lotta people use Jstevie... on every conceivable personal computer/workstation/mainframe).....

Thanx a million billion trillion jillion ga-jillion!!!

BTW, for an example of JIS codes, just trying perusing any newsgroup starting with fj (eg fj.rec.pachinko...)

Vaya con Dios,
AcEzE. ☐

I've seen W9 v3.75 screen savers used on a Viking Moniterm monitor and
can say that only a few of them seem to work as expected. The built-in
inverter works fine, but the loadable extendos sometimes work, sometimes
leave the large monitor intact while blanking the small monitor, and
sometimes just don't do anything at all to the large monitor. Can't say
anything about how well it works in color...

2652. Atari TT without FPU

Newsgroup: comp.sys.atari.st
Date: 1993-02-13 05:43:16 UTC
From: akisujar@nuscc.nus.sg
Message-ID: <1993Feb13.054316.24273@nuscc.nus.sg>
Source record: 210221

Hi,

I am thinking of temporary removing the FPU (Co-processor) from my TT and install it into the Mac LC III because most of my Atari programs don't support or make full use of the FPU but several Macintosh program that I want to use on the LC III will not run without the co-processor.

My questions are:

1. Will the TT works without a co-processor?
2. Do I have to move any jumper after removing the FPU chip?

I am looking for a mono. emulator which will work not crash RDE/RDY. I have tried BIGCOLOR, but it completely removes the RAM disk. It appears that it is allocating memory near the top of the TPA and dropping the _memtop variable in order to survive a reset.

Any help on this would be appreciated.

Of course, we don't have to worry about any software breaking on the Falcon. :-) Seriously, what do you mean by lots. Would you care to give a number to back this up? Is it more than 50%?

> - I don't know about it's internal video, but the video on the LC, LC II

>

The LC III has a separate VRAM (512K standard, enough to support up to 256 colors o displays as large as 16") so there would be no memory contention with the cpu unlike the ci,si... Besides, don't forget the LC III has a 32-bit bus versus 16 for the Falcon.

>
> RSB

In ZNET93.05 there is a compatibility list being compiled Cottonwood Computers - unfortunately they didn't list what version of the Falcon they are doing their testing on - but that aside (they also didn't mention if they "installed" some of the applications they said didn't work or if they just tried to run them from disk) Most of the programs tested were application/utility/business software but some educational and games were tested: Their results -

RUN: Mixed up Mother Goose, Geography Tutor, Typing Tutors, Wordquest, RC Aerochopper, All Aboard, Dungeon Master, Skate Tribe, The Black Cauldron, Winnie the Pooh

Some that didn't: Magical Math, Battletech (not able to load - bad disk or not?), Conqueror, Cyberdrome (see note below), Midimaze II.

Note: I think I remember seeing a note from John Hutchinson emphatically stating that Cyberdrome does work on Falcon.

The ratio is no where near as bad as indicated above from this very limited sampling. So far a very limited testing in the gaming area - and Cottonwood didn't say exactly what version of Falcon (beta or production?) and what software the programs were tested under (with or without multi-TOS?)

Hopefully they have heard this feedback and will add this info to their compatibility listing. I think its a great service they are providing despite the missing info. Thank you for taking the time and effort, Cottonwood. Wayne

Well, the FastRam cards for the TT will only use Toshiba or Samsung brand SIMMS - I had to wait 2 MONTHS to get my 32MB RAM card working. And, the 32 Bit SIMMS are better that your plain vanilla SIMMS.

> - Has there been a Mac (ever) that didn't break lots of software upon

Well, this have *NOT* happened on the Atari side has it? There were no problems with the STE or the TT, nooooooooooooooo :-). Incompability problems generally come from crappy programming.

> - I'd pick on the lackluster number of slots, but in comparison w/ the
> Falcon, this seems pointless.

Yup.

> - I don't know about it's internal video, but the video on the LC, LC II

All the LC models has their own VRAM like the Quadras. The IIsi is a drain when it comes to video, but the LC's are in fact pretty OK!

> - Apple has a little distribution problem right now. It seems they
> can't make computers fast enough. Now, I *have* heard claims that

Like Atari hasn't got production problems... BTW, as far as I've heard, the LCIII is opne of the machines that has got highes priority in production.

>Gosh, I'm disappointed, I thought I could dig harder than that. Well, it

>all those sounds on the Macs here in the lab, so I haven't kept up.

The Falcon sound is of course vastly superior campared to that on the Macs. Sound suppport is however pretty weak on the Atari s/w side. There seems to be chaos when it comes to formats and productive use of it. Sound people will get a lot out of the Falcon, no doubt about it. It might be Atari's own fault that people don't use the features of the machines, though - the dev manual for the TT didn't include a squat about the SCSI or the LAN port...

>Of course the Mac games situation is a little bleek to (but it gets better

I'm quite sure DCFormat 3.02 *does* (optionally) do a verify pass; I always used to select verify on when I used it for formatting. It also claims, if it finds bad sectors, to mark them as bad. However, I've never been convinced that this actually does any good under TOS - anybody know?

As far as I know the dedicated expansion bus can support Fast RAM. But it is still 16bit wide and 'compatible' to 68000 operation. I believe that this also says that it is as slow as needed for an 68000 only.

>bytes of data cache and with the program accessing 2048 bytes per loop
>iteration, I am satisfied that the cache has been taken into account.

Doesn't help :)

The program basically does the following:

a) measure the time needed for a loop consisting of MOVE instructions.
b) measure the time needed for an equivalent number of NOP instructions.
c) subtract both times.

This produces good results on 68000 since the MOVE instruction needs the
same time as the NOP instruction _plus_ the time needed to transfer the
data.

On the 68030 this does produce house numbers since instruction fetch
(from cache and prefetch queue) takes place concurrently with the data
transfer. If the transfer lasts longer than the instruction then the loop
is completely determined by the external bus accesses. The time measured
in a) is what you need. If the bus is faster you run into problems for
determining bus speed and you have to deal with the specific instruction
timing.

Let me whole-heartedly apologize for my Amero-centrism. I think since
I quoted Amercan prices I limited it to the usa (sorry!). I know that Macweek
has a time-lag to get to Europe too!!

Anyway, I alays here how good Atari/Amiga is doing in Europe, but I here
them from Atari/Amiga people (and sales figures along don't tell the whole
story). I was wondering if you'd give us *your* insights on how well
Atari/Amiga/PC/Macs are doing in your area. It just might be a little
more objective....

Someone told me that they just passed new laws stating that all monitors
must be adjustable and because of that Apple cannot sell the Classic II or
the Color Classic II in Europe. Do you know anything about that?

>a number to back this up? Is it more than 50%?

Hmmm. I have to go dig up stuff on the ci. The si and LC only broke software that needed the FPU (I believe) but that covered all the major spreadsheets including Excell. The 040's on the other had were delayed about 6 month because Apple could not get Sys 7 to run correctly on them. And when they were released, several programs broke becasue the 040 cache is different than the 030 cache (and they didn't know they would have to trap for that). I don't have the numbers but I remember the excited squeals of the first brave Quadra owners when major apps were found to (finally) work with it. Hell, Word 5.1 *still* has problems with the Quadras (as it's not 32-bit clean, and why would you want a Quadra if it's not running 32-bit?). Some just posted the other day, that his DTP friend wouldn't run his stuff on a Quadra as it was still to flaky (not a reliable source/datapoint).

So, I think the ci/Quadra might have got a ~50% fail rate on "real" programs. But the si and LC hubbub was predicted and headed off as it happened, so I don't really know. But, I mentioned it so Atari people don't feel left out. Hey do you know how much trouble Multifinder caused? It took *years* to staighten out. MTOS here we come.....

If you *really* care, I could go out and find a list circa the time of release for the si and Quadra and find out. (ci is just *too* old).

>
>Come on, Apples' supply problem is trivial compared to Atari's.

Agreed. Again, I posted mainly from "Mac" mode, more how a Mac user would see the world. But, rember, Atari is not the only company with supply problems! (Apple is just on a different scale, and soon NeXT will have no supply!!! Wahhhhhhhh!)

2667. Re: SPICE Simulation Program Integrated Circuit Emphasis

Newsgroup: comp.sys.atari.st
Date: 1993-02-13 18:37:55 UTC
From: Oliver.Frick@arbi.informatik.uni-oldenburg.de
Message-ID: <1993Feb13.184616.20104@arbi.Informatik.Uni-Oldenburg.DE>
Source record: 210212
Cross-posted to: comp.sys.atari.st,comp.sys.atari.tech

Yes, there is a newer version of SPICE exsisting and there is also a program
to visualize the SPICE-result-files, called SPICELINE.

The SPICE-Version (2G6) is just licensed by the university of Berkeley which
allows us to deal with it as a commercial product and give full support to
the user.
SPICLINE parses the OUTFILES of SPICE and visualizes AC-/DC-/Transient- and
Fourieranalysis-tables in diagrams. It can draw upto 12 curves in one diagram
and every curve can be zoomed seperately.
It is possible to save the diagrams as IMG-files in a free choicable reso-
lution.

We distribute these two products since Nov.'92 in germany. The point, which
is a problem for the rest of the world is: SPICELINE has a german user-
interface and a german documentation. We dont't consider to translate it,
until we know the scale of interest in the rest of the world.

I'll upload a demo-version of SPICELINE (hope they will accept it) to the
atari.archive.umich.edu from where you can download it.
(The version I will upload is V1.01. There are newer ones (<=V1.21) but I
am away from my computer and this version is the newest I have with me.
The actual version will follow in some weeks.
V1.01 has some bugs which are killed in the later versions and probably
a lot of undetected ones :-))

If you are interested in the programs, or have some questions, then write
me an email, because we are just reorganizing our distribution-structures,
so I can't tell you the address of our ditribution-company at this time.

The actual prices of the programs are
SPICE 99.- Deutsche Mark (Sorry, I don't know the exchange rates)
SPICELINE 129.- DM
(incl. support)

Oliver Frick (author of SPICELINE)

I just acquired an HP QuietJet printer... It's not a great printer, but it's not bad (at least compared to my Panasonic KX-P 1124). I'd like to try using it with Calamus, but all I have is the HP laser and DeskJet drivers. They make it print at weird proportions, like double normal size and there are lines in the middle of the letters that it doesn't print. Does anyone have a Calamus printer driver for this thing?

Thanks,

Dan Aylward

Source record: 210227

Well Apple just sold its tenth millionth Mac...1993 will be a banner year for Mac sales...Apple is expected to sell three to four million Macs in 1993. Atari is being left behind...Its pathetic that Atari is not capable of bringing one model to the market while in the past four months Apple has brought a dozen or so new Macs to the market.

Does Atari honestly believe they are going to sell the Falcon at $1399.

I can get a color classic 4/80 for $1189.00
Mac LCIII 4/160 for $1190.00
Mac IIVX 5/80 with CD for $1793.00
Mac Centris 610 4/80 for $1425.00
These educational prices are from the University of Northern Iowa...

Apple has reduced the Mac LCII 4/40 from $1239 to $849.00.

I think that Atari users should move on. Get A Mac.....The software is so much better...

as far as i can tell, the main reason to have GNU zip (at the moment) is to be able to access the GNU archives (eg prep.ai.mit.edu) which are starting to store files compressed with GNU zip (vs the old way using compress, ie the .Z files). GNU zip is in effect a higher performance compression system. i suspect that as far as GNU software for the atari world is concerned, zoo will remain the archiver of choice, however, for distribution in our world.

from what i can see, GNU zip is meant to be used in conjunction with tar (GNU tar, would be the obvious choice) in that it itself does not make archives from separate files, but rather takes a single file (archive) and compresses it. the rather poor choice of suffixes (.z) collides with the old System V (unix) pack/unpack programs. other than that, it seems to do its job well. GNU zip appears to build/work fine on unix. i have not tried it on the ST (yet), though i suspect no particular problems, except perhaps with TOS name limitations, ie file.tar.z vs file.tz or whatever, and file.Z (compress) vs file.z (GNU zip). GNU could have picked a better suffix, IMHO (.g, ,.G, .gz, .GZ, .zz, .ZZ, .ZP, .gzip, .gzp, etc). .z is silly since both MS-DOS and TOS don't support case, making a compressed file only distiguishable from a GNU zipped file via magic number. i know that compress checks the magic number, hopefully GNU zip does, too. so this may not be that big of a problem. with (unix) utilities like file(1), this potential problem could be eased.

i don't think there is much of a relationship between ST zip and GNU zip other than the packing algorithm and perhaps some file header similarities. since i have not looked into this in detail, i can't vouch for any compatibility or lack thereof.

: John

Here's a short note from the first article in this thread:

---snap---
GNU zip is the successor of COMPRESS (and PACK). It gives you better
compression-ratios in next to every case. It also eradicates the (in)famous
problems imposed by COMPRESS when trying to depack files created on a
big-memory computer with your 1MB Atari. Just to make the switch easy, the
author also has put in routines that can decompress COMPRESSed and PACKed
files.
---snap---

It was actually designed to run under *ix from the beginning, but as I also
wrote in my other post it now runs on several different platforms. On the
Atari it works both with and without MiNT. However, due to its *ix-
inheritance it works best on top of a Minix filesystem. It doesn't work
properly with 8+3-filenames yet (however, 8+2 works fine :-), but that
will hopefully be corrected in a future version. Please read the README and
README.ST files from the gzip-archive for more information about compatiblity
and stuff like that.

And yes, it's a TOS TAKES PARAMETERS-type of program. You can run it both
from the desktop (and enter the parameters in the dialog) or from a shell
(tcsh is my personal favourite). However, if you run it from the desktop
you will probably loose most output since it will disappear immediately
after the program has finished when the desktop is redrawn.

Hope this helps...

Sorry of this has been asked before (I couldn't see where) but...

Is there any program out there for the ST that will allow me to convert
*.au sound files from the UNIX to some sort of ST format to be played on the
ST? If you can reply by mail, it'd be greatly appreciated.

Bill, you're absolutely right. ZOO is the way too go on Atari.

[stuff deleted]
: the rather poor choice of suffixes (.z) collides with
: the old System V (unix) pack/unpack programs.

Yes, I agree with you that it's a bad choice, but according to the author
(Jean-loup Gailly, jloup@chorus.fr) it was the 'least' bad. It removes the
necessity to rewrite/recompile TAR which can be forced to use .z (instead
of .Z) with a switch. And since GNU zip includes code to decompress PACKed
files (it automagically senses what kind of file it is :-) it shouldn't
present you with much problems once you've _replaced_ (un)pack with gzip.
However, people that doesn't know of GNU zip will of course become confused
when their old SysV unpack starts to barf at .z-files. :-)

[stuff deleted]
: i don't think there is much of a relationship between ST zip and GNU zip
: other than the packing algorithm and perhaps some file header similarities.
: since i have not looked into this in detail, i can't vouch for any
: compatibility or lack thereof.

GNU zip is supposed to create PKZip/InfoZip-compatible archives. That ought
to indicate that it also creates ST zip-compatible archives. Unfortunately
I haven't tried to decompress .z-files with anything but GNU zip yet. It is
also said that GNU zip should be able to decompress PKZip/InfoZip-archives
with _ONE_ member (archives containing just one file). I haven't tried this
either yet. I'll try it and report to this newsgroup what the results are.

Happy packing...

Source record: 210220

It seems I pissed off a couple of Atari users who sent me E-mail. Actually i am an Atari user too. I own a lynx and is better than that lame boy.

I thought about getting a Falcon when Atari announced it last summer. When Atari announced an intro date I took it as a grain of salt. They just lie and lie.. It tells me that there not serious about competing anymore. You pay what you get for!!!!! So mac owners paid more, but they got a better supported product with continous improvements. The reason Atari hasn't done well in the past and present is that they sell on the cheap...I guess the Tramiels failed Business 101 when a question was asked on a test which they answered false "There is a strong corealation between the percentage of Research and Development spending and return on investments.." Of course this question is true....

I will comment on this section and I will be dam if some users want to violate my rights of freedom of speach protected under the constitution..

And another thing the person who sent me E-mail said mac users have a less IQ because of the Mac OS...Mac users have a life, they want to run their quality software. Nobody knows about the Falcon and they will never know....

2686. Re: GNU zip v1.0.2 binaries available

Newsgroup: comp.sys.atari.st

Well, I'm quoting myself here. Cool... NOT! :-)

: GNU zip is supposed to create PKZip/InfoZip-compatible archives. That ought
: to indicate that it also creates ST zip-compatible archives. Unfortunately
: I haven't tried to decompress .z-files with anything but GNU zip yet. It is
: also said that GNU zip should be able to decompress PKZip/InfoZip-archives
: with _ONE_ member (archives containing just one file). I haven't tried this
: either yet. I'll try it and report to this newsgroup what the results are.

After a couple of quick tests I can verify what I wrote above. It is
compatible with PKZip/InfoZip if the archive only contains one member.
I haven't tested ST zip, but I guess it's compatible with PKZip, which
also would make it compatible with GNU zip.

But who knows? Maybe ST zip only is 99.9% compatible with the new PKZip
v2.04g (or whatever :-), which with some 'luck' could break GNU zip. The
archiver-market is a real swamp!

Life's a bitch... ;-)

^^

I guess this is what makes the number to high. Turn off the cache
of the 68030, it can be done (just turn off the data cache, you can
keep the instruction cache on, although on real-life stuff like games,
the instruction cache would not be a big boon in speed since the cache
is small).

|>
|> I do agree, the numbers appear too high to me. That was another reason to

|> if both the instructions and the data are in the cache, there is no fetch
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
Again, this could be the problem. If we are
going to measure transfer rates to the falcon ram
we can't take the data cache into account. A game
transfering moving objects would have to flush
the cache a lot I think. A small benchmark

can get away with that.

|> delay so you can indeed execute an instruction in 2 cycles. Also, given the parallelism in the 68030 design, you can have one instruction executing

2690. GFA Basic 3.0x wanted

Newsgroup: comp.sys.atari.st
Date: 1993-02-14 03:36:28 UTC
From: ekrimen@wet.UUCP
Message-ID: <5316@wet.UUCP>
Source record: 210215

I'm looking for a used copy of GFA Basic 3.0x if anyone has a copy they'd like to sell. Please send e-mail.

Also, I suppose I should mention that Bob Brodie and Mike Fulton demoed the Falcon, AtariWorks, SpeedoGDOS, and other related software at our user group meeting today. They did an excellent job on a fantastic demonstration. Oh, but I suppose you don't want to hear anything about it since you'd prefer to bash and argue amongst yourselves. Nevermind that I brought up the subject.

2692. Japanese and Chinese on the ST

Newsgroup: comp.sys.atari.st
Date: 1993-02-14 05:51:32 UTC
From: giggey@ecf.toronto.edu
Message-ID: <C2FC9w.M9C@ecf.toronto.edu>
Source record: 210226

I am sorry to have to resort to this, but I was unable to reach certain helpful persons through E-mail (this system doesn't seem to recognize them).

Anyways, I am interested in getting any chinese or japanese word processor for the atari ST.

CHINDEX was a nice programme, but I really can't see the point in it. Looking up characters through strokes to find pronounciation or vice-versa seem rather useless to me. (ie what is the point, anyone who knows the language will know those anyways).

Then there was an interesting programme from a Mr. Jin LiWen. It looked promicing, but the doccumentation took too much knowledge for granted. I still don't know what a GB-format file is, nor what HXYZ is or does. So the programme is not too useful to me. Any light that can be shed on the subject would be greatly appreciated.

Even though there SEEM to be programmes to display certain characters, there seem not to be any programmes to do any real word-processing like activities on the ST in either Japanese or Chinese.

Any help is appreciated --greatly!

Actually, you should forget about Mercury. It is very out-of-date. On the
other hand, Hermes UUCP is an excellent package that is still being updated
regularly. It does a *lot* of stuff that Mercury never did. It really is
a very good program, and well worth registering.

>The program basically does the following:
[description deleted]

If that is the way that the program runs, then won't the time saved
by caching the MOV command be equal to the time saved by having all the
NOP commands cached? That way, when you subtract times, it is still accurate
as the NOP should cache as often (if not moreso) than the MOV command.

In fact, regarding the effect of parallelism in the '030, wouldn't
the NOPs experience the same parallelism as the MOV commands (again, perhaps
moreso), so that time lost due to this will be the same for MOV?

In what way does the MOV command take less time than the NOP?

>more objective....

Well, Commodore Norway has cut down on their number of emplyees (who doesn't in these times) and Atari have closed their Scandinavian offices wile searching for new distributors (I've heard they have one little distributor serving the music market here and that another bigger deal may be secured later). So, I don't think that neither the Amiga nor the Atari is doing so well up here, but the Mac sure is alive and kicking. Sales are rising and there are plenty of knowlegdeable dealers (my cousin is one of 'em - I get Macs cheap, why do I still stick with Atari?? Guess I like 'em...).

>Someone told me that they just passed new laws stating that all monitors

The Color Classic will be sold here, I have that confirmed. I haven't heard about that new law at all. Might be a new Swedish thing, though.

Nop on the 68030 and 68040(i guess) synchronizes the pipelines....

And there is another program that can be used with SPICE:

The circuit editor CIRCU IT! is able to export the circuit layouts that were generated using the mouse(!) only in a form that can be analysed by SPICE.

So it is very easy to generate the input files for SPICE. You don't need to write long ASCII-files - you just draw the circuit to be analysed.

CIRCU IT! is available from:
Think! Software GmbH
Scharnhorststrasse
8500 Nuernberg 10
Germany

At the end of february the newest version of FORTUNE for the Falcon
will be placed to atari.archive.umich.edu. Fortune V1.0 will not only
play sound fortunes, it will be able to convert the following file types:
- DVSM
- AVR
- SND
- AU
- WAVE
- RAW data

Hmm, I just the know a handful of $50-$80 MIDI interfaces that go to the
serial port. I haven't seen a MIDI program that does not use the serial
port either.

>as the NOP should cache as often (if not moreso) than the MOV command.

No. The problem isn't that the cache is faster for opcode fetches but that
opcode fetches and data transfer are done in _parallel_.

> In fact, regarding the effect of parallelism in the '030, wouldn't
>the NOPs experience the same parallelism as the MOV commands (again, perhaps
>moreso), so that time lost due to this will be the same for MOV?

The parallelism is just in the data transfer. The MOVE overlaps with the
previous memory cycles thus hiding the time needed for it. A NOP does not
do memory cycles, so it can't be hidden.

> In what way does the MOV command take less time than the NOP?

It does not take less time. In fact, it even takes longer. The subsequent
numbers are 68020 so the situation might be slightly different for 68030.

case 1:

```
MOVE.L d0,(a0)+ ; 6 clocks for the move
MOVE.L d0,(a0)+ ; 6 clocks for the move parallel to 5 clocks for the write
MOVE.L d0,(a0)+ ; 6 clocks for the move parallel to 5 clocks for the write
MOVE.L d0,(a0)+ ; 6 clocks for the move parallel to 5 clocks for the write
; 5 clocks for the write
```

the last write will of course overlap with the next instruction. Anyway,
the total time taken is 29 clocks. The 5 clocks are A3000 fast memory.

```
MOVE.L d0,(a0)+ ; 6 clocks for the move
MOVE.L d0,(a0)+ ; 6 clocks for the move parallel to 14 clocks for the write
MOVE.L d0,(a0)+ ; 6 clocks for the move parallel to 14 clocks for the write
MOVE.L d0,(a0)+ ; 6 clocks for the move parallel to 14 clocks for the write
; 14 clocks for the write
```

the 14 clocks are for chip memory. the total time taken is 62 clocks. If
you unroll a larger loop and take account for the loop instructions you
will see that the time for the loop runs asymptotically against the longer
of either the 6 clocks for the MOVE instruction or the number of clocks
for the write cycle.

If the memory is faster than 6 clocks you will just see the time for the MOVE.
If the memory is slower you will just see the time for the data transfer.

case 2:

```
NOP ; 2 clocks
NOP ; 2 clocks
NOP ; 2 clocks
NOP ; 2 clocks
```

The time for the NOP loop is independant of any memory cycles. If you now subtract this time say from the time needed for the chip memory MOVE loop you will artificially increase the 'measured' speed as you subtract some estimated overhead that does not exist. This is true for all memory that is slower than the MOVE instruction itself. Even in the case where the memory is faster you must not subtract the time for the NOP but would have to know how fast cycles are to estimate the instruction overhead. Of course, that's what you just want to determine :)

Regards,

I think the "Straight Fax" fax modem software has caller id, or soon will have. Since I don't have a fax modem or the software I'm not positive. It's been discussed a lot on GEnie and I had the impression St.Fax was ready for it when people got the new Supra fax roms.

Anyone out there with the software? Correct me if I'm wrong, please.

Dave Ninjajr Flory, cupertino.portal.com

In article <1l612nINNc98@ub.d.umn.edu> awest@ub.d.umn.edu (The Piano Man) writes:
> First of all, is there a PD/shareware Pascal compiler out there that works??

There are no PD or shareware Pascal compilers available for the ST that I'm aware of. Personal Pascal is a pretty good option that you can get mail-order for about $60. And they're occasionally posted here used (someone had one here in the last week or two for $10, which is as close to PD as you're going to get!).

Personal Pascal also sometimes goes by the names CCD/OSS/ICD Pascal, and ST Pascal+. Other alternatives are Prospero Pascal at ~$100, and what I consider to be one of the best, HighSpeed Pascal (at ~$120 from Toad). HighSpeed is a fast, mostly Turbo5-compatible system with a nice integrated development environment and hypertext help system.

> I have the two from umich archive, but I can't figure out what to do...(the
> one, PP_DEMO, has German docs, (leider, mein Deutsch ist nicht so gut!) and
> the other, (PascalII) just burps, and complains, and basically doesn't do
> much. Does anyone have docs for these (more complete ones) or a compiler
> that works?!

Pascal II is just an alternative shell for the Personal Pascal compiler, i.e. it gives you a way to run a commandline compiler from GEM more conveniently.

PPP_DEMO is a demo version of the Pure Pascal compiler, marketed in the U.S. by Gribnif (with English menus, but German manual and help system). Advantages over HighSpeed are an integrated source-level debugger, a bit better Turbo compatibility, TP6 oop capabilities, an unlimited number of windows in the development environment, dynamic text scrolling, and a few other nicities. If the manual and help were in English it would be a serious alternative to HighSpeed, but at this point I still prefer HSP.

The retail price for Pure Pascal is $250, but from what I saw in the demo, the environment and editor is fully functional and can load and save files, you can compile and run (and debug). You just can't save object or executable files (or units), and there's no help file (at least in the demo on a.a). So for casual playing around, the PP_DEMO is a very nice free alternative.

On the other hand, if you want something with documentation, you're going to have to buy something.

2706. Free (almost) Software

Newsgroup: comp.sys.atari.st
Date: 1993-02-14 17:37:41 UTC
From: ritz@ritz.mordor.com
Message-ID: <930214602@ritz.mordor.com>
Source record: 210158

I was digging through my closet today (finally becoming a landowner
and moving) and I found a bunch of old Atari stuff. I will give
all the software titles away for US$3 each. I figure that is about
what it will cost to ship plus enough to buy one cold beer. :)
The only caveat is that I cannot find any of the manuals (probably gave
em away when I got rid of the ST). I have these games:

Ogre
Skyfox
High Roller
Silent Service

I also found the EZRAM II software disk that came with my
RAM upgrade. Whoever wants this, can have it for $2.

Why am I doing this? Well, I'm from the school of thought that
it is shameful to toss out a good book. Software is just the
electronic equivalent of a book so I'd hate to see the disks
go to waste if somebody wants 'em.

I'll give the disks to the first person/people who offers me
the $3/disk or the best offer after a few days.

Also, if somebody who lives in New York City or northern NJ
wants to pick them up, he/she can have the whole lot for free.
(Well, you can bring me a cold beer. <grin>)

Oh yeah, I have about 60 blank 720k diskettes that I used with
my ST. Anyone who wants those can take them for $0.25/each.

Regards,

Chris

Unfortuanately, it is not confirmed weather Cannon will continure to make
NeXT hardware. I hope they will, and since Cannon recently entered the
compter market (selling '486's) I think they might want to make a workstation
and thus make the NeXT designed PowerPC workstation (able to run PowerOpen
Taligent and NeXTStep), and I have already heard rumors to this extent.

On the lighter side, NeXT said they had enough machines to fill orders
till May 25, but several large companies placed huge orders and they had
to reopen the factor and make more!! A shame that all is going well, *after*
they get out of hardware. I hope Cannon does take this as a signal to
contiue to produce black hardware...

2708. Why are Atari peripherals so expensive?

Newsgroup: comp.sys.atari.st
Date: 1993-02-14 19:48:22 UTC
From: ortega@cactus.org
Message-ID: <1993Feb14.194822.4084@cactus.org>
Source record: 210244

Why are Atari peripherals so expensive?

Best Buy is selling the Dexxa International hand scanner
for $84.77.

My latest Toad Computers catalog lists the Golden Image
hand scanner for $199 and the Migraph hand scanner for $259.

Why is there such a huge price difference?

Has anyone any idea how to modify the Dexxa scanner for
ST use?

It's getting really tempting to not wait for the Falcon and
to go clone instead in spite of my bias against the Intel
platform.

> Line-F emulator, _FPU cookie

If you had a line-f emulator, wouldn't you just set the cookie to
indicate a hardware 68881/2 using the coprocessor interface? The whole
point of the emulator is to make it appear as though the hardware is there
even when it isn't. (I'm assuming we're talking about a resident emulator.)

If there was a need to let programs know whether they're getting emulated
68881/2 or The Real Thing, then maybe a bit in the lower word of the
cookie value should be defined. The docs I have indicate that the low
word is reserved for describing software FP support. (I have this feeling
that Atari has already done this, but I can't find my most recent newsletter.)

I don't know about that. I bought a MIDI interface for my Amiga. I bought MIDI software for my Amiga. They work together. Every MIDI interface I'm aware of for the Amiga uses the serial port. Every MIDI package for the Amiga uses the serial port. Seems pretty standard to me. I think you're wrong on this one.

Well, at least you Atari-people have a tradition
of writing demos, like us Amigans.

You won't get _that_ on a Mac, all you get is a hold-your-hand-til-you-die-GUI,
a kludge of programs and millions of fellow Mac (L..ooops) users who likes to think that
"shift-right" has something to do with their keyboard. I mean, there are even PC-freaks
out there who knows how to code...

So, there's actually _something_ that's not bad about Atari & Atari-users :)

Hey, are the hardware-refs for the Falcon-hardware available to the public ?

(Commodore won't give us the HW-Ref of the new Amiga-architectures,
not that it matters much; even a mediocre coder can force that wall :(

>to high res, or raising the line on the monitor port, causing the interupt
>controller chip to do a hard reboot, having the same effect as turning the
>machine immedialty on then off again

Even this is unnecessary. Back when I only had a Mono monitor and a TV,
I programmed in mono, then ran the program, and it printed up "unplug monitor",
which I would do, then it would procede... requesting the monitor be
replugged when finished. It simply requires grabbing the monochrome-detect
vector.

> What hasn't been answered is an obvious question. will the software be
updated so that a current spectre cartridge will run on a falcon? If not,
no falcon for me.

The Falcon has a different cartridge port, so why bother!?

The previous-to-falcon machines wouldn't be able to handle to sort
of resolutions the Mac' is displaying these days (basically VGA).

WHy would anyone want to Emulate a Mac-Plus, on a Falcon!? There will
be disk-drivers being made probably as we speak, to read Amoeba, and

Macintosh disks (among others) on the Falcon.

The Spectre 4.? If Dave Small ever x
decides it will be worth doing, will almost definitely support colour
(he'd be mad not to...) In which case, why emulate a Mac-Plus, when
you can Emulate a Mac LC-II at pretty much the same speed, same resolution,
and same capability!? (Of course the Falcon is capable of much more,
but it's all there!)

Buying a Falcon just to run Spectre GCR on it would be pretty dumb
any-way! You should be able to get a Mac-Plus for the price of the
Falcon, so get the real thing!

Resolution switching only involves running the processes after
the AUTO-folder loading.

E.g. Switches into new resolution, re-loads accessories so they are
configured for the new resolution, and reload the NEWDESK.INF (presuming
that's what the Falcon uses for a DESKTOP.INF file) for location of
icons etc.

All non-reset-proof programs usually stay-put! (e.g. Warp-9, UIS_III,
RAM-Disks....)

I know I'm replying to the wrong person, but I've picked up half-way
through the thread!

1. You have your shell running.
2. You have make running.

Solution:

make -n >temp
source temp

(eg. under Mupfel:

make -n >temp.mup
./temp

)

Okay, I don't have a Falcon, but I found your (Neil's) description of
the "serious bug" to be pretty odd. You described how such-and-such
direct hardware manipulation didn't work on the Falcon, while it did
work on the ST. There is an XBIOS call, Setscreen, that does what you
wanted to do [I think]... but you know that. I can't see how direct
access to the hardware's screen-access addresses would find approval
from Dave Baggett! :) [I'm assuming Neil used such screen code in GWB]

If I have mis-remembered you posting, appols!

David there are 2 very good programs for uudecoding and coding
by Steve Yelvington..

One is called UUCODER1 and the other is APPEND, this chap was on the net last
year but have not seen him for some time, he also updated UUCODER to version
1.1 but then lost the code..

Also note, with his coder/decoder you don't have to remove the headers/trailers
etc, just use his APPEND program...

Here are his mail addresses.....

2729. Atari-TT SCSI-bus problems

Newsgroup: comp.sys.atari.st
Date: 1993-02-15 07:26:43 UTC
From: leo@ahwau.ahold.nl
Message-ID: <C2HBCK.4ou@ahwau.ahold.nl>
Source record: 210163
Cross-posted to: comp.sys.atari.st,comp.periphs.scsi

I am experiencing some weird problems on my atari-TT's SCSI-bus.
I am experiencing some strange problems on the SCSI bus of my TT. I have
the following configuration:
Internal: Seagate harddisk 40Mb (terminated)
External: Maxtor harddisk 80Mb (last in chain and terminated)
Tandberg tapstreamer (not terminated)

Whenever my TT is running for a few hours in this configuration, data
writes to the maxtor get erroneous. That means, I get no errors from the
drive but 1 or more bits in a data block are wrong. I even tried enabeling
the parity check but that will give me no parity errors.
The problems disappear when the Tandberg is disconnected. The problem never
shows up on the internal drive.
The external cable is a 25pin sub-d connector (Mac. SCSI cable) the maximum
length (from TT to the Maxtor) is about 70cm. The chip driving the bus
is an NCR5380.

It seems to me that everything is within the SCSI spec's and I can't
figure out why this won't work.

Regards, Leo.

2731. Are there hardware MS-DOS emulators for a TT?

Newsgroup: comp.sys.atari.st
Date: 1993-02-15 09:13:17 UTC
From: kunstm@prl.philips.nl
Message-ID: <1993Feb15.091317.18376@prl.philips.nl>
Source record: 210176

A friend of mine has a TT (I still have a ST which is fine to me). Now he needs to run MS-DOS (he doesn't want to, but he has to). He now has two options:

1) add a PC-card and keep going atari.
2) go into the strange world of MS-DOS by buying a clone.

I'd like to stop him from buying DOS, so my question is: are there any good hardware MS-DOS emulators for a TT, something like a 386SX board?

Mark

From: cj195@cleveland.Freenet.Edu
Message-ID: <1lnpm8INN392@usenet.INS.CWRU.Edu>
Source record: 210168

There is a file, pgp21.zip in the public domain which allows public key encryption for the Atari ST. It is a port from other systems.

Does anyone know where I can get a copy? I've already tried the archive at the University of Michigan and an ftp site at ftp.uni-kl.de without success.

I've used ARCHIE to no avail. Lots of pgp21.zip. Nothing for the ST. But I know its available because it used to be at ftp.uni-kl.de.

So maybe it can't have a toaster, well thank god cos it's so expencive;)

There will be cheeper and maybe as good hardware for it I think. The Toaster is Impressive, but far from the best I have seen. It can be done better perhaps even cheeper.

Similarly Lattice C. The manual defines (my memory's rusty) a floating
point mode (is the FPU memory-mapped onto the CPU address space???)
which works on SFP004s and Mega STEs and TTs and (prob.) Falcons.

This means of course that only one program can use the FPU at a time,
so no DAs. Is this a seriously dumb idea or what?

I hope I'm wrong about all this, but I recall warnings not to use FPUs
in 'resident' programs in the Lattice docs.

The DSP has nothing to do with this at the moment (sigh...): Everything
is done by the CPU ;-)

A program that is useful for the ST is SOX from atari.archive.umich.edu. But
I don't know which formats can be converted with this program.

This is most likely a BIOS problem. I would guess that you have an AMI BIOS
in your PC at work [works fine with many disk formats] and a Phoenix BIOS at
home [complete crap].

I have never seen a DD vs HD drive problem on 3.5" disks though. I am familiar
with the problem you described on 5.25" disks, but not on 3.5" ones.

Maybe your HD drive at home isn't jumpered properly and attempts to detect
density by reading in both densities instead of checking the HD hole?

Indeed!

>All you have to do is cat ALL of the *.uaa etc. files together in
>order and it'll create the binary. It even ignores message headers & such.

Yes, and it also checks for space truncation and seqence characters. It also evaluates a character transposition table, to correct transfer problems that occurred in the old days when most of the Atari binaries had to be transmitted via BITNET/EARN in the EBCDIC character set. Note that you don't have to cat the stuff together if you have the proper filenames.

> Can't remember who wrote it... Moshe Braner (sp?) ??

No, it was Jean-Pierre Dumas [hence the name "Dumas uuencode"].
There is also a uue to go with it, that creates the table and optionally splits the uuencoded output.

> color.

24 bit = 16 million colours. Your eye cannot see that many colours.
256,000 colours. Your eye cannot see that many colours.

Spot the difference?

Your eye can see approx 40 intensity levels for each of Red, Green and Blue.
Now lets say we have a super person who can see 50 levels for each of Red,
Green and Blue.

50 x 50 x 50 => 2500 x 50 = 125,000 colours.

Thats still only half as many as 256,000 colours, and thats for an above
average person.

The real point is:- Are these 256,000 colours evenly spread? If they are then
you won't be able to see all of the colours. If they aren't then it may be
that part of the colour spectrum we see is not represented properly by the
Falcon colour pallette, in which case you will be able to say it isn't
true colour. That said, you can use the very same argument against a 24 bit
card.

Just thought I'd throw that in.

Huh? Since when has a word been 24 bits? Granted word is an arbitary term, but usually means 16 or 32 bits. Furthermore you use the term in the paragraph below to mean 16 bits (though you are refering to the 68030, not the 56000).

I'm not flaming, just curious.

2745. NeoDesk 3.03 ?

Newsgroup: comp.sys.atari.st
Date: 1993-02-15 12:36:40 UTC
From: csucf@csv.warwick.ac.uk
Message-ID: <1lo2ooINNane@lily.csv.warwick.ac.uk>
Source record: 210110

I got a news letter from gribnif software a while ago, and it mentioned
NeoDesk 3.03 being released in December 1992 (if I remember rightly)
It also said that an upgrade disk would be sent to me free of charge
(or at least that's what I read it as being)

So could anyone tell me... Has it been released yet?

The details of it sounded quite good, giving it some of the features that
are missing from 3.02 but in TOS >2 and I am looking forward to getting
hold of it

Thanks for any help.....

Could you either post the reply (as I'm sure others would be interested) or
mail me (grw@ukc.ac.uk - a friend is posting this for me)

An expansion card for the Archimedies has recently been released that can only do 32000 colours, and they call that true colour as well. It is obvious that all the term "true colour" means is "a lot of colours".

You are incorrect. The human eye can distinguish 256 levels
of red and blue, and 512 levels of green. 2^8*2^8*2^9,
25 bits. Computers use 24 bit pallettes because it's hard to
arrange a 9-bit value for conversion to analog.

You are mistaking "level" and "hue", and hue is irrelavent to
brightness or darkness.

"True color" means 24 bit color. That's it. Anyone
using it for 15/16 bit displays is using it incorrectly.
Those are, properly, referred to as "high color" displays.

Used, obviously not programmed. If you use GEM, it will software reboot.
If you change from Mono to Colour it will also reboot. If you don't use GEM
(funny, as a game programmer, I don't :-)). If you do use colour (funny, as a
game programmer, I do :-)) and don't use GEM, no problem at all.

The 56001 DSP in the Falcon was designed to be cheaper than a 32 bit
version (96001?), but better than a 16-bitter. It uses a word length of
24 bits, to ensure good results with rounding etc.

That is wrong. The videomemory (wich is the same as the system memory
(upto 14MB)) resides on a expansion bus. It is fairly simple to replace the
ramboard with a combined videocard and ramcard with direct 32 bit access to
system ram!

Don't ever say something can't be done if you haven't realy tried to do it!!!

From: aa399@cleveland.Freenet.Edu
Message-ID: <1lobpeINNkkj@usenet.INS.CWRU.Edu>
Source record: 210196

Someone mentioned that using the 640x480 15-bit graphics would be impossible since moving all of the sprites would eat up a lot of time. They said that the Motorola 68030 16 MHz is underpowered.

Is this true?

Could the Blitter be used to speed things up?

Oh, by the way, I'm talking about using it for games.

If you can do some fantastic games in that resolution, you can just about do anything with it.

Source record: 210195

Hi there. I've had a few responses, all of which stated that Civilisation was already available; unfortunately this doesn't appear to be the case. Although it's been reviewed in ST Review (and quite favourably) most of the places I've spoken to say that the release date has been put back until March. If anyone out there has actually seen it in the shops or (gasp!) bought it, could they let me know where? Cheers...

From: carsten@hrz.uni-bielefeld.de
Message-ID: <C2Hz97.8qn@hermes.hrz.uni-bielefeld.de>
Source record: 210104

Hi,
I am trying to connect my STE to an IRIS Indigo and I want to run TCP/IP
via the serial port of the IRIS.
I want to use ka9q for the TCP/IP protocol.
Is it possible to use only the three lines transmit data (TD), receive data
(RD), and signal ground (SG) with ka9q?

Has anybody prepared *.net files that can be used to do this or the files for
the direct connection without a phone line to another UNIX machine?

Perhaps there might be even someone who can tell me how to `tell` the IRIS
to run TCP/IP via the serial port.

Carsten Menke

Yes. It's very easy to show that 24-bit color is not
enough, especially if you're doing 3D rendering. Where
did you pull out your other figures from?

The 256K colors are as evenly spread as if you had a linear
DAC. What do you mean by evenly spread? By the DAC's view,
by the monitor's view, or by the humans view?

The DSP56001 has a word size of 24 bits. And it can actually
address more than 32Kwords -- more like 192 Kwords, but God knows
how Atari hooked the thing up.

You know, you should stop making stupid generalizations.
True color is completely meaningless since it changes meaning
when you talk to different people. For example, say that to
an X programmer, and it will say things about whether or not
the colormap is writable. It's not uncommon to see a 1-bit
Truecolor display. Can't people just say 24-bit color and
be done with it?

: 256,000 colours. Your eye cannot see that many colours.

This is incredibly false and misleading. While both of those fall true
if we are talking about ONE color range, we are easily capable of
differentiating between two 24-bit colors.

How do I know? Books. Besides that, anyone with an Amiga can do
something quite simple: Start at a red value of 0, and go all the way up
to 255. Put them on the screen in blocks next to each other. You will
be able to see where one block ends and the next begins. It will not
look continuous.

: Your eye can see approx 40 intensity levels for each of Red, Green and Blue.
: Now lets say we have a super person who can see 50 levels for each of Red,
: Green and Blue.

More than that. You can easily spot >256 intensity levels of the colors,
especially green, where the human eye has more sensitivity.

Funny, my paint programs allow me to modify the screen via various brushes and tools. Are you telling me that other systems can't do that??? A paint program can be a VERY good tool to tell video bandwidth by--if, for example, a brush moves rather slowly and jerkily, you know that you're lacking bandwidth, or you've got a slow CPU. If you're using a 1200, the slow CPU part shouldn't really be much of a factor...

Generally a video resolution, horizontal resolution can easily be added through just a bit of overscan. The aspect ratio _IS_ very strange, though. I personally would advise 800x600, with a good degree of overscan.

Oh, you're just in a tissy because your Mac emulator can't use it...

For someone who has about as much understanding of the Amiga as I do
about the mating cycle of the red-breasted swillsucker, you sure like to
cut it down. If you don't like the resolution, that's fine:

1) Get off your lazy ass, become a developer, and learn how to
design your own resolutions, or

2) Use something else. It's not as if there aren't others there.

(Sorry for the length of time this took, things got busy...)

From: don@cc.gatech.edu (Don Allison)

[...]
With the ICD board, I essentially got
a Mega STe out of my STe, since I got a 16 MHz 68000 with a 16K cache.
The other thing I got which I don't think the Fast Tech boards provide
(except perhaps their 030 one) is a socket for a 68881, which was a requirement
for me. All told, I got a decent performance upgrade for under $250...any
of the 030 upgrades, when configured like I would have wanted them would
have cost $1000 or more! If I'm going to spend that much to get TT performance
I'll just buy a TT!

On the STe (where the processor was socketed) installation was easy. I was
a bit worried that it wouldn't stay seated, since it rocked out easily, but
so far it's been running great. The only problems I've seen are a bit of
a strange interaction between their DA and MiNT (a couple of the buttons
aren't accessible, as if the setup program didn't run, or got overwritten),
but rerunning the program fixes this--I assume I just need to play with
my auto folder to get everything in the right order. Also, the graphics
accelerator that they ship with it is the precursor to Warp 9, and occasionally
leaves a shadow where a window was, but I blame that on the Quick ST program.
All in all, I'm quite happy with ICD products (I have their hard drive
interface also).

In summary, if you are looking for something to extend the life of your
ST/STe for a few years while waiting for the next great revolution in
computing to occur, I would heartily recommend the ICD AdSpeed upgrade!
I figure this should keep me going til the Falcon 040 shows up (if it
ever does).

Don Allison
don@cc.gatech.edu

From: 01mbmccabe@leo.bsuvc.BSU.EDU

Price-wise, you may as well get an Atari TT030 over a SST upgrade -- minimum
upgrade is ~$800 or $900 from Toad Computers.

-Matt

I'd like to thank both Don and Matt for taking the time to write back.
I take it that not many people upgrade the 68000 in the ST?

john

I have heard the term for exactly two things:

a) true color == 24bit color because this is more (sort of) than what the
human eye can resolve

b) true color == does not use a color palette

Wrong.
True colour means 'no palette'.
There is no hardware palette look up tables.
If the hardware does this, and supports 32000 colours, so be it.
You seem to think (and so do many others) that True colour means
'infinite' (or close to) number of colours.
This is the case with the FALCON and the ARC.
ok.

>
> You know, you should stop making stupid generalizations.
>True color is completely meaningless since it changes meaning
>when you talk to different people.

Quite simply, you are wrong. A lot of people over in a different
group are trying to come up with a rationalization for their
(mistaken) belief that the 21st century starts Jan 1, 2000, and
they are using all sorts of methods like "maybe the first century
was 99 years..". They are wrong--a century is 100 years, and not
99, not 101--only 100.

TrueColor is a tradematk of AT&T in reference to it's Targa
cards. It refer to 24 bit color and _only_ 24 bit color. I don't
care what other people want to use it to mean, that's what
it properly means. A lot of people think 'pulchritude' means
'ugly' and they are WRONG. It doesn't matter how many people
think something incorrect or use something incorrectly--they
are still *wrong*. Period.

> For example, say that to
>an X programmer, and it will say things about whether or not
>the colormap is writable. It's not uncommon to see a 1-bit
>Truecolor display. Can't people just say 24-bit color and
>be done with it?

Their ignorance is not my problem. They can think it means
whatever they choose--be it purple poodles to stuffed
dinosaurs--that doesn't change the meaning.

The problem turned out to be a lack of space on my hard disk. Space ran out
while zoo21 was unpacking NETHACK.TOS -- it just exited leaving an
incomplete binary. I deleted some old stuff and now have NetHack working.

Thanks to all who either mailed or posted replies.

I said it in the spirit of the original posting. BTW, the Video Slot
in the Amiga is more than just access to video memory, which is why the
Video Toaster could be done at such a price. NewTek said that the same
kind of product could have costed 3-4 times more on a Mac/PC platform.

So, yes, it could be done (expensevily done, at least more than
on the Amiga), and at the same time the Amiga *does* MIDI.

This is how I know it:
compressing and decompressing is done by the same program

Try copying COMPRESS.TTP to UNCOMPRE.TTP

It worked with COMPRESS.EXE on a PC

On Unix uncompress is just a link to compress

Compress determines what it should do by the name by which it was called

> 256,000 colours. Your eye cannot see that many colours.

Funny, maybe I am Superman or something, but I can see the difference between 18bit and 24bit color. It may be true that the average person canonot detect 256k different colors, but most people can see that there are smoother color transitions with 24bit color than with 18bit color.

>Spot the difference?

Yes, the 24bit palette is superior to the 18bit palette.

>Your eye can see approx 40 intensity levels for each of Red, Green and Blue.
>Now lets say we have a super person who can see 50 levels for each of Red,

>
>Thats still only half as many as 256,000 colours, and thats for an above
>average person.

If you are so certain that mere human beings cannot tell the difference between 18bit and 24bit color, I have a little test for you. Using a paint program, draw a section of color which fades from the darkest shade to the lightest shade. Black->Pure White, Black->Pure Red, etc. will be sufficient for this test. On a machine with 24bit color, there will be 256 different levels, on a machine with 18bit color there will be 64.

I don't know about you, but in my real-world experience, I can see that there is a big difference between the two. There is a significant amount of banding in the 18bit display that is much less noticable in the 24bit display. The result is that a 24bit display can more accurately display the color transitions in a photograph and can smoothly shade objects in a rendering.

>The real point is:- Are these 256,000 colours evenly spread? If they are then
>you won't be able to see all of the colours. If they aren't then it may be
>that part of the colour spectrum we see is not represented properly by the
>Falcon colour pallette, in which case you will be able to say it isn't
>true colour. That said, you can use the very same argument against a 24 bit
>card.

There are plenty of people who will say that 24bits is really not enough
and that they can detect 256 diffferent shades of a particular color. I
don't know what the next jump is going to be, but I'm willing to bet that
someday folks will be sneering at 24bit color just as they are at 18bit
and 12bit color today. But hey, that's progress, and things will only
continue to get better and look better in the future.

>Just thought I'd throw that in.

Of course there is no way I'd be able to just stand by and not add my
own thoughts as well. :-)

No, actually it is best suited for video work. You do realize that a lot
of Amiga users own Amiga for just that don't you? Just like a lot of
Mac owners own Macs just to use as fancy typewriters.

Marc, why must you try to find something bad in anything that anyone or anything that is even remotely Amiga related? Are you really such a poor excuse for a human being that you can do nothing else but bitch and whine about everything? Do you really think that you are having an effect on anyone except to piss them off?

In any case, despite what you may believe, this mode can be used for much more than just viewing pictures. You will probably scream that it cannot be used for productivity, but I will remind you to try thinking about what the word "productivity" means before spouting off so quickly. If someone is creating something useful, such as a picture, a rendering, a screen for use in a video, etc., they are being productive. Can you handle that much, or are you so pig-headed as to believe that only things like spreadsheets, word processors, and that sort of thing are productive?

Try getting a bit of a clue before posting next time, there are folks who read your posts and are watching for your inaccuracies and lies.

Atari has never bothered with the markets which Apple is trying to reach (i.e. corporate sales).

>Its pathetic that Atari is not capable of bringing
>one model to the market while in the past four months Apple has brought a dozen
>or so new Macs to the market.

Any computer company that relies on more than one or two basic models is asking for trouble. Things will be worse than the current PC-clone configuration problems.

>Does Atari honestly believe they are going to sell the Falcon at $1399.

I suppose they do.

>These educational prices are from the University of Northern Iowa...

It's nice to see that you can get educational pricing. The majority of people who are going to purchase those 3-4 million Macintosh systems this year will not have the advantage of such excellent price breaks.

>Apple has reduced the Mac LCII 4/40 from $1239 to $849.00.

Discontinued hardware is always reduced for 'quick sale'. Of the LC II, IIsi and IIci systems our university offers, they only have 5 IIci systems without hard drive left.

>I think that Atari users should move on.

Some will, some won't. Many computer users will never purchase another system in their lifetime. Your advice is noted, but don't expect us all to jump on your bandwagon ...

>Get A Mac.....The software is so much better...

Get an Intel clone. There is a much larger set of software, and much of the professional software blows rings around Macintosh software.

Hope you enjoy your Apple Macintosh.

>colors as a maximum. I guess an average person might see like 3-6 (my guess).

I guess that's what you get when you ask a psychologist to
speculate on the color sensitivity of the eye instead of asking
an opthamologist (as I have), which is proper.

Time to go over it again. I suppose you guys think that
reading in the dark will "damage your eyes" as well.

The human eye can distinguish approximately 25 bits of
color--that is, 8 bits each of red and blue and 9 bits
of green.

Now, don't misunderstand me here--your retina is not matching
up directly (so conveniently!) to these binary values--those are
simply the highest values that delivered meaningful results, using
16 bits of brightness didn't improve results. And there is always
a margin of error (but the 8-8-9 model is pretty accurate).

However--let's assume that these are the *exact* values (they
aren't) for the sake of simplicity. It would be enormously
inconvenient to deal with 9 bits of green, so we cut that down
to 8 (256 levels). Also, you have to remember that the lighting
situation plays a good part in what you actually see--but even
more so, the *monitor* determines what colors are actually
shown, and the colorspace for a monitor--even a really nice
trinitron or whatever--is very narrow relative to the maximum
colorspace of the human eye. Also, monitors are not color
constant (differing from tube manufacturer to manufacturer) so
the situation is even worse. What looks solid-red on one
monitor may look slightly magenta on another. The quality of
the product differes *far* too much for it to ever hit the
already imperfect color variety provided by 24 bit color.

The world is moving towards 24 bit color for a number of
reasons, but mostly because it's the easy model to deal with.
It has nothing to do whatsoever, as some people seem to think,

with showing "all of the colors the eye can possibly see"..

>|> Your eye can see approx 40 intensity levels for each of Red, Green and Blue.
>|> Now lets say we have a super person who can see 50 levels for each of Red,
>|> Green and Blue.

You can *easily* see more than 50 levels of RGB. Do you actually
use a computer?

50 levels each of RGB also == 50 shades of grey, which is
quite easy to shw as inadequate.

Greetings Friends.

I've just picked up a nice almost new, mega STE to replace a 6 year old FM.
When I tried using PC DITTO, to check my Modula 2 assignment, it hung.
Well lets be more detailed. PCD comes up with its screen. Press Space etc.
DOS loads, then just sits there. Cursor flashing. Its as if it doesn't know your there.
(Well this is MS DOS.)

Any idea's etc?

Cheers and Beers

h>now becomes - how do we specify things in the _FPU cookie? We need values
h>that mean "no FPU, 68000 emulator installed" or "SFP and emulator installed"
h>in addition to "no FPU code at all" and "FPU in coprocessor mode
h>installed"...

Wait a second - Atari defined these things in the cookie specs...

(copied from TT TOS release notes, page 11)

The _FPU cookie describes what hardware and software floating-point support is installed in the machine. The low word of the cookie's value describes software floating-point support; currently, this is always zero, but Atari may assign values in the future for software floating-point support packages. Notably, the requires software to support some of the instructions that the 68881/68882 execute on-chip.

The high word describes the hardware floating-point installed in your system. Note that the "unsure" cases result because the BIOS probes for the 6888x without determining which FPU you have. If some software cares, it can probe,, and reset the cookie's value accordingly. The BIOS always installs an _FPU cookie, even with zero value, so floating-point support software can change the low word when it installs itself.

_FPU cookie (high word)

Value Meaning
0 No hardware FPU detected
1 SFP004 or compatible; 68881 as peripheral
2 68881 or 68882, unsure which, as coprocessor
3 68881 or 68882 plus SFP 004
4 68881 for sure
5 68881 plus SFP004
6 68882 for sure
7 68882 plus SFP004
8 68040's internal floating-point support
9 68040 plus SFP004

The low word is reserved for software use, my proposal is to use the same numbering scheme.
So, in other words, we'd have to set up the low word for the type of FPU we emulate and leave the high word as is:

LineF 68882 software emulation (no SFP004 present): _FPU 00000006 hex.
LineF 68882 software emulation by using a hardware SFP004: 00010006 hex.

Full 68882 command set by software on an 68040 with internal FPU: 00090006

A 68881 emulation would have 0004 in the low word.

This should be handed to Atari as a proposal by the software author (which I am NOT :-)

2793. ICD Link

Newsgroup: comp.sys.atari.st
Date: 1993-02-15 21:55:59 UTC
From: jhauser@boojum.CS.Berkeley.EDU
Message-ID: <1lp3hf$l2u@agate.berkeley.edu>
Source record: 210134

I just got an ICD Link, together with a SCSI ``external'' hard disk, to finally add a hard disk to my ST. The Link has been widely touted as a simple way to hook up SCSI devices to the ACSI interface of the ST, but after poking around in the manuals that came with all this hardware it doesn't look like it's going to be as simple as I expected.

The problem is with the ``termination power'' line on the SCSI bus. You see, the Link has no power supply of its own, and there's no power available from the ACSI connector, so the device is constructed to draw its power from the so-called ``termination power'' line on the SCSI bus. Of course, for the Link, this would be on the hard disk side. However, as near as I can tell, the quasi-convention for this line is that it's supposed to be powered by the computer! This means that the typical Mac-like hard disk that comes conveniently packaged in its own external case does _not_ supply power on this line. At least, the one I bought doesn't. Nor, does it seem, should any other SCSI peripherals, if they're going to work with machines like the Mac which _do_ drive this line.

So is anybody using this miracle Link without some specially-made SCSI device to provide the power??

The simplest way to get power to the Link would be to open up the hard drive case and directly connect the drive's +5V power to this line. This is not a terribly difficult operation, but it does two things. First, it voids the warrantee on the drive, which I'd prefer not to have to do. And second, it makes the drive a potential cause of damage to another computer---like a Mac---if it's ever hooked up to one without this ``fix'' being undone first.

The alternative is to drive the line from somewhere else on the bus. For instance, I could make a short little piece of connecting cable with this line tied to a source of power. The power could easily come from one of those ubiquitous ``plug-in'' black-box power supplies. However, this is more than a little bit of work; more than I thought I was getting into, in fact. I also thought of trying to hack a terminator and do this at the far end of the bus, but so far all the terminators I've seen are entombed in a solid piece of molded plastic and are thus not easily hackable.

Could anybody tell me a better way to solve this little power problem? I'm a little annoyed that ICD glosses over the problem so innocently.

Not true!! I bet the majority of those machines (prob 75%) are Classics,
Classic IIs, SE's, and LCs. *All* of these machines run Sys 7! They may
look a little anemic with only 4 Megs, but they still work. A lot of
new software isn't the fastest on them either, but Excel, Work, Macwrite,
etc. still run reasonably (I use Word 5 every day, speaking of edu prices,
it only cost me $80!). One of my friends is running Sys 7 on a Mac 128
upgraded to Plus level (to date his total upgrade price is <$500). Now
what Mac cannot run Sys 7?

>It's nice to see that you can get educational pricing. The majority of people
>who are going to purchase those 3-4 million Macintosh systems this year will
>not have the advantage of such excellent price breaks.

Yes but that doesn't change the fact that the *list* of an LC III 4/80 is
$1378. That's in the same ballpark as a Falcon030 4/65. (and of course,
some people *can* get those neat educational prices...). Of course any
reasonable Mac monitor is going to cost more than a ST monitor or a
VGA monitor.

Blast it, why do people keep quoting educational prices like the whole
world is still in school?!? And then compare it to Atari prices for
general retail?

> Does Atari honestly believe they are going to sell the Falcon at $1399.

This is the price for adults. It is unfortunate that Atari doesn't have
educational discounts, but it is also stupid to compare apples and oranges.
It would be relevant to post the Apple prices for general retail.

Hi, for people who may have been having problems with the Ghostscript SLM driver, here are some (highly edited) excerpts from email sent to me by Martin Rothaemel. They may be helpful.

Mr. Rothaemel also created an icon for Ghostscript, for those who know how to use it (I don't).

From martin@risc.techem.ruhr-uni-bochum.de Wed Feb 10 11:25:03 1993
Subject: Re: Re: Problems with Glostscript

thank you very much for your mail to me concerning my problems with Ghostscript and the Atari SLM. Fortunately, now I know where the problem that all Ghostscript print-outs on the SLM printer were just blank pages, came from:
I used a very old version of the DIABLO emulation software, 1.1. After I got the version 1.4 from sun.rz.tu-clausthal.de everything works very fine. Maybe this information is also interesting for other ATARI users with an SLM because at least on my original ATARI program disk only this very old DIABLO version was included.
Now I really enjoy working with Ghostscript and DVIPS.

The exact location where everybody can find the DIABLO emulator version 1.4 is

/pub/atari/systools/printing/slm.lzh
at
sun.rz.tu-clausthal.de

Concerning you question about memory problems when printing >10 pages via Ghostscript on the SLM ....

I printed out the PS documentation for the F2C converter without problems. [>20 pages using lots of fonts].

"Inspired" by the nice icons that are available for Ghostscript in the WINDOWS and OS/2-Version I designed an similar icon also for the ATARI. I use it now with the german GEMINI desktop replacement but I think also with TOS version > 2 it is possible to iinclude extern RSC files. You can have a look at this icon and maybe include it in the ghostscript distribution. I copied this file (GHOST.RSC) to the FTP server of our department (where it is the only file at all...).
You can get it via anonymous ftp at
tap.techem.ruhr-uni-bochum.de
in the public directory.

Bye

Martin

The reason I think that musicians will overlook Atari is that I have been told
by numerous sources that the Mac does MIDI sequencing better than Atari,
especially at the high end. I'd believe this. So would a lot of people wanting
to start MIDI work. So alot of people will go Mac before Atari. Now, whether
or not it is true that the Mac can do MIDI better is not the issue - people
assume it can, so they believe it can, and then Atari loses sales.

Not in all conditions you can't. Try to find say a single red pixel that differs by one intensity level in a large solid field of intermediate intensity red. Whether its 24 bit or 18 bit, you won't be able to see it.

> canonot detect 256k different colors, but most people can see that there
> are smoother color transitions with 24bit color than with 18bit color.

There's the key: smoother color transitions. The retina is a very good edge detector, so "banding" can be visible in 18 (and even in 24) bit color transitions where a sufficiently large area contains a slow enough transition. If the area is too small, or the transition to fast, you won't detect the color edges (banding) in the transition.

> If you are so certain that mere human beings cannot tell the difference
> between 18bit and 24bit color, I have a little test for you. Using a
> paint program, draw a section of color which fades from the darkest shade
> to the lightest shade. Black->Pure White, Black->Pure Red, etc. will be
> sufficient for this test. On a machine with 24bit color, there will be
> 256 different levels, on a machine with 18bit color there will be 64.

This is true, again because you've created nice intensity "edges" for the retina to find. Try the same test, but this time dither the transitions. Then compare the 18 bit and 24 bit versions and see how much difference you can perceive.

> I don't know about you, but in my real-world experience, I can see that
> there is a big difference between the two. There is a significant amount
> of banding in the 18bit display that is much less noticable in the 24bit
> display. The result is that a 24bit display can more accurately display
> the color transitions in a photograph and can smoothly shade objects in
> a rendering.

Most photographs do not contain the noiseless color transitions that 3D computer rendered scenes contain. The high detail in a photograph acts like color "noise" and has the same visual effect as dithering. The synthetically smooth color transitions in computer generated imagery can cause banding even at 24 bits. Generally, a subjectively better image can be obtained by rendering at a higher number of bits that can be displayed and then dithering the output down to the display color resolution.

> There are plenty of people who will say that 24bits is really not enough
> and that they can detect 256 diffferent shades of a particular color. I

> continue to get better and look better in the future.

If you want a computer generated image to look good on a 24 bit display, render the image at 36 bits and dither it down to 24 bits with a good random dither. I don't think its necessary for the display device to go higher than 24 bits per pixel, but much can be gained from higher color resolution in the computer 3D rendering programs.

> [...] The result is an artificial high number printed as 'bus speed'.
>

The quickest way to settle this is to know some facts:-

The Falcon 030 is known to be capable of displaying approx 880x620 8-bit pixels @ 61 Hz noninterlaced. Since that requires a bus speed of at least 32 MB/s, it would seem that Howard Chu gave a pretty good guess of the CPU-memory speed.

Now for the benefit of expediency, assume that 32 MB/s is 100% of the bus bandwidth of the Falcon.

For the programmer who is creating a game using the 320x200 8 bits/pixel mode which takes up about 4 MB/s, that would mean 28 MB/s is available for the CPU and blitter.

Note that 28 MB/s available in the Falcon is 400% more bandwidth than the A1200/A4000's Chipbus bw of 7 MB/s! But the greatest advantage the Falcon possesses over the Amigas is the chunky-pixel architecture, because it allows the programmer to accomplish in one memory access, compared to at least eight accesses of the Amiga bitplanes. The 800% advantage of the Falcon's chunky versus the Amiga bitplanes *combined* with the 400% advantage of the bus speed means the only one thing: the Falcon 030 has a graphics performance "envelope" far beyond the Amigas and many other systems on the market.

The absolutely surprising aspect of the Falcon 030 is that Atari could scale it up to a full 32-bit machine running at 32 Mhz and simply blow every other PC 486 and Mac Quadra off the planet!

James

>> TrueColor is a tradematk of AT&T
>
>And 'true color' are just 2 english words.

What's your point? The derivation is obvious and so is the intended meaning.

Someone else mentioned that definitions change. Well, this is sometime true. Indeed, often. But it is not true for words that have clearly defined meanings (like "century" which is defined as 100 years, or "dozen" that refers to 12, not 13 and not 11) and "true color" as defined by the company that introduced the term refers to 24 bit color--not 15/16 bits, not some weird hack that allows real time modification to produce several hundred thousand colors--t_w_e_n_t_y_f_o_u_r_b_i_t_s. The definition hasn't changed, people are simply using the word incorrectly.

The correct label for 15/16 bit color is "high color" as defined by the companies that introduced the chipsets to produce the display. Anything in between is something else again, but it's not "true color" if it's not 24 bits.

Manufacturers who are claiming that their cards, if they are less than 24 bit color, are "true color" cards are lying and deliberately trying to mislead. Defend them if you like, but they are no more telling the truth in that matter than they are selling a 24 bit product.

This type of discussion reminds me of Amiga users who claim that XX Amiga card can outdraw an SGI machine. It's not true, it's obvious, yet the devout followers of the Amiga priesthood believe with almost religious frenzy. If Amiga manufacturer says "true color" it MUST be true color, even if in the PC and Mac world this term has a clear and precise definition.

It's because Micro$oft doesn't design _anything_ in the first place.
They see what sells, and then come out with their own version (ie, buy
something that's already done and owned by a smaller company; or sue the
smaller company out of existance).

Oh, and their own version just happens to work better with MS-DOS or
MS-Windoze or MS-whatever. Go figure.

At least they had the brains to license True Type instead of BitStream's
Speedo... (But that's a flame for another day...)

I am sure a few million are on borderline obsolete. But there are no installed base of the Falcon..When is this machine going to be released? Now speaking of those obsolete Macs, how many ST's can display 8 bit color...I bit 99.9% can't. There are about 2.5 - 3.0 million St's worldwide...I bet 99.9% are obsolete..

If Atari can get the Falcon on the market in March, than it would have beaten the new 14 inch color classic that is power pc ready by one month(April release)...Wow!!!!!!!!!!

There's either going to have to be a _serious_ increase in the number of
FPU'd ST/TT/Falcons or one industrious programmer before this gets
done... I imagine you could count the number of FPUs actually being
used for something in a signed char...

No way! The C++ compiler binary is over 1M in size... You could use
pfxpak to shrink it, but then you'd probably run out of memory real
quick while compile C++ code...

Heat & Serve Sozobon C does the job well!

It's available in the Programming directory on atari.archive.umich.edu
in the atari section!

(Works fine from floppy, and with only 1/2meg of RAM!)

How 'bout some information then Ed? You're not exactly one to keep
quiet; maybe you're saving it for later.

How well did AtariWorks work with MultiTOS? Did it hog the system/RAM?
Did it let you do all the things you should expect from an _Atari_
product (ie, iconize, whatever other new MultiTOS abilities there are)?
Did Speedo hog the system (ATM on my '486 at work hogs the system...)?

Depends on the scanner quality. Some might only scan 200 dots per inch,
while others handle 600 dots per inch!

Also, some are color, some aren't. Some have more features, etc.

Check the spec's, and that might show why! It also depends on where
you get it from! (Could be up to 25% difference in prices....)

> 'ugly' and they are WRONG. It doesn't matter how many people
> think something incorrect or use something incorrectly--they
> are still *wrong*. Period.

TrueColor (capital T and C, all one word) is an AT&T trademark for
the TARGA (and only the TARGA) 24bit color system. True color (2 words) is
not a trademark of anything.

Lingustically, true color is a term in dispute, as it is a new
term. The explaination that makes most sense to me is as a referent for
color systems in which each pixel is directly adressable to the limitation
of the system - so VGA graphics are a 256 color true color system, A500
Hires is a 16 color true color system OR a 4096 variable-dependant color
system, and A1200/4000 is 256 true color system or 256,000 color
variable-dependant color system. "variable-dependant" (not a common use
term) means that the color of one pixel is influenced by a neigbohring
pixel.

So, we're all disappointed with the 68000 slot in the Falcon030... Has anyone heard any plans for it?

Ok, sure I've heard that Dave Small is thinking of a nice MacII emulator (K00L! I'd love to see that!), and that someone else is working on an Intel x86 card of some sort...

What I want to know is... will any of the Falcon's cards be designed so that _more_than_one_ card can be installed at the same time? Or isn't this feasible on the 68000 slot?

Many Mac cards designed for Macs with only one slot have a pass-through slot so you can plug another card in. Hopefully, Atari's hardware design doesn't make this impossible.

I'm looking for 8-bit sample playing code using the sound-chip. I want to add the Mac samples from NetHack 3.1 into the Atari ST version. The sample playing code that I have is petty poor...

C preferred, or 68k assembly. The sample can take over most of the computer if necessary since I'll be loading/unloading the samples when necessary to conserve RAM (for those 2M users); I don't need code that will play a sample in the background.

We got the sample playing code from ReSound at atari.archive and re-wrote it in MadMac assembler; we can call it from C like this:

```
int spl_play( char *buff, long buff_length, int sample_speed );
```

Any suggestions? Any _donations_? :-) Email me if you'd like to help make the Atari ST version of NetHack 3.1 even cooler...

Thanks!

Easy fixed, just wait a couple of months, and then do a big advertisement
saying 'Cheap, fully compatible emulation of Mac & IBM available' That'll
pull them in! (Especially, if they can have a Mac', IBM compat', and
Falcon, in one machine, for less than the Price of one of the more
recent Mac's 8-) (If you are really lucky :)

You are probably right though, and it's a shame, Mac's deserve it,
the only problem I have with them is their price of hard-ware & software,
what a bunch of cutthroats! But, IBM compat's need a lot of work until
they are really *good* machines!
(Stick real sound into them, a real OS etc. It's fine for some, but
not for others :)

>educational and games were tested: Their results -

Well from what I read in the December ST-Review U.K. magazine, they stated from Atari that the Falcon was not ST compatible, also some of the software that Cottonwood claim to run did not..

Also none of the games would run, well out of the 6 that they tried, the problem with all this testing is that you must try all the features, well like 1ST WORD PLUS would bomb when you tried to load a IMG Pic...

I have also noted is one list that Ataries own Arrakis would not run...

What we need is a Real list and how they were tested, what versions etc...

But that would take some 100 years..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

I have since found out that this is a load of bull. Many SCSI devices _do_
supply ``termination power'', including the hard drive that I bought.
Apparently this is very common---at least for newer devices. (Don't know
about older ones.) I apologize for any distress my previous posting may
have caused. (I only discovered my mistake by actually measuring the
voltage with a multimeter. What a surprise!)

I still have a problem with the Link, though. When I boot from the ``host
adapter disk'', I'm told that there's an Adaptec 4000/4070/5500 controller
out there, but no ICD Host Adapter. Because there's allegedly no ICD Host
Adapter, much of the software refuses to run. The programs that _will_ run
say they can't find anything---even when I can see the drive light blink as
the software ``searches'' for a SCSI device. And what's more, there isn't
any Adaptec controller there that I know of; it's a Quantum SCSI drive.
I took the box apart, and there's no controller other than what's on the
bare drive.

Anybody? What's going on here?

Repeal prohibition. History repeats itself. Repeal prohibition. History r

2831. Re: Why are Atari peripherals so expensive?

Newsgroup: comp.sys.atari.st
Date: 1993-02-16 08:00:26 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <75747@cup.portal.com>
Source record: 210021

The answer to the question of why Atari peripherals are so expensive is a common economic factor called "economy of scale".

Migraph and Golden Image know that their sales to Atari owners will be measured in a few dozens or low hundreds at the most. Therefore they have to charge more per sale to make up their expenses for development and marketing.

A company making or distributing a similar product for the IBM market knows that their sales will be numbered in the *thousands* and thus can reduce the amount they charge for each unit, because they can reduce their expenses by producing the product in large volumes.

2833. FTPable GIF viewers?

Newsgroup: comp.sys.atari.st
Date: 1993-02-16 08:24:39 UTC
From: jamesl@cie-2.uoregon.edu
Message-ID: <1lq8c7$o6o@pith.uoregon.edu>
Source record: 210023

Hi. I was just wondering if anyone could reccommend any good GIF viewers that are available via FTP. I have tried a couple (BGIF and GIFFER) and the results were abysmal, producing low-resolution pictures that were barely discernable, when I could get past the 'out of memory' errors. Mostly just random-looking collections of dots on a background. I'm told the ST (mine's a 1040 with no modifications) isn't really compatible with the GIF format, but are there any PD programs available that would give a halfway viewable result? I'd spend money if I had any to spend, but for now I have to settle for the cheapest route possible.

I would be most grateful for any help anyone could give. I'm not sure email can reach me at the moment, so posting might work best.

Thanks!

There seems to be some confusion between the DSP 56001's 8-bit host interface port and its serial ports. The Falcon 030 has a serial port (similar to the NeXT but with more control signals) that is capable of 1 MB/s transfers.

The DSP in the Falcon has its host port memory mapped so it would be reasonable to expect that the 8-bit port would be capable of at least 8 MB/s transfers. Anyone familiar with the 56001 specs know for sure?

>And I'm no. three.

To add 1 to the Canadian count, here I am. (I heard Atari sold a lot of TT's here in Canada...for our relatively small population (vs US))

I have a lowly 4STx4TT megs of RAM (wish I had sprung for the 16TT, or configurable board, dammit... 32MB (+8 ST RAM??? =40MB???!) doesn't sound bad, either).

How do all you other TT owners feel about Falcons? Planning on upgrading (or is it downgrading???)? Should I stick with my TT and just buy a funky Crazy Dots VME card for better-than-falcon graphics? Wait for an 040?

The Falcon has the facility for 2 new multi-button (12/20+??) joysticks by
Atari which are supposed to be very nice. I think 12+ buttons should be
sufficient for most/all games. The Falcon developer guidelines recommend that
all new Falcon games support these new ports.

Not that I believe SFII would sell many Falcons unless it was better than
the SNES version (not that I'd play it anyway) and came with the machine
in a pack like SFII/SNES pack available here (if not in USA as well)

Anyway the point is that the old Atari VCS standard joysticks are more than
a little limiting these days and I look forward to supporting the new
Atari standard joysticks in our games...

I havn't seen a 24 bit display, but with grey scale images I can't tell the difference between 6 and 7 bits, to me that means that 18 bit and 24 bit display's will look pretty similar. Maybe I need to find myself a radioactive spider...

|> the color transitions in a photograph and can smoothly shade objects in
|> a rendering.

Ah, but you perceive boundaries differently - if you place grey scale
"stairs" on the screen, the colours do not look uniform across each stair,
the darker side of a boundary looks even darker and the lighter side looks
lighter. In real life how large a slab of a pure shade will you get?

Something that seems to have been missed from this discussion so far is pixel
size, or more importantly the size of the pixel image on your retina - you can't
even see colour if the point is too small. So all these tests for how many
intensity levels you can see must use fairly large solid unrealistic slabs of
colour.
Either that or the pixel size is large.

|>
|> >The real point is:- Are these 256,000 colours evenly spread? If they are then

|> someday folks will be sneering at 24bit color just as they are at 18bit
|> and 12bit color today. But hey, that's progress, and things will only
|> continue to get better and look better in the future.

Hmm, but now I think we're getting into the realm of subjective brightness,
from everything I've read 6 bits is about the human limit from black to
white (by which I mean pure red green, blue or any combination). But those
6 bits are on a sliding scale, so in dim light you can see 6 bits and in
bright light you can see 6 bits, the difference being that you perceive black
and white diferently - take how black a shadow can look in bright sunlight,
but when a cloud comes across it fades to grey.

|>
|> >Just thought I'd throw that in.
|>
|> Of course there is no way I'd be able to just stand by and not add my
|> own thoughts as well. :-)

If you're really interested in all this stuff (and loads more) then there's
this book "Digital Image Processing" by Gonzalez and Woods. It's got a good
introduction to perception.

Have you checked the prices on Macs latey? Or the prices of software? Mac prices are very reasonable nowadays. (Although the monitor prices need a little work!!) And the software is not as expensive as everyone thinks it is. (I'll agree that Microsoft Word, or Excel is very expensive, so don't use them then, there are many other programs out there tochoose from.)

SLIP is just a protocl (Serial Line IP) that allows IP-connections via
serial line (such as modem).
I am working with the ka9q packages - so i cant explain hermes :-(

> At present, I would probably be running it in a Mupfel shell,

>I physically have to create the connection each time? (I suppose
>I might be able to use Connect to do a script login, if it
>has some sort of "cron" feature to it)...

There are several ways to establish a slip-connection.
If the modem is connect directly to a workstation you have to run
a daemon to use slip... If you are connecting via a terminal-server
(the way i do) the term-server must support the slip-protocol.
Ask your local sysadmin to obtain further information...

> And of course, how would I tie in a FTP/TELNET option into this?
>I'm a bit of a novice when it comes to networking, so I'm
>learning from the net...

After starting ka9q you will get a net> shell. You are able to start
servers (ftp, telnet, smtp, finger etc.) and to use some clients
(ftp, telnet, finger, ping etc.).

> Anyways, any help would be appreciated. It would be cool
>to have my own site, so...

Hmmm... I think it isn't a good idea to set up his own site:
1) are you 24h online? via modem?
--> other hosts want to connect toyour host (e.g. mail processing)
2) what are the advantages of your own site? (assuming you have an
account on another station)
--> you have to admin your site, you have to queue mail etc.
3) does the sysadmins of the network trust other ip-addresses?
--> once you are connected to the internet you are able to use
"privileged" ports (having "root"-access on your atari :-)) etc.

I am using slip, because i am able to have two telnet-session, one ftp-
session etc. at the same time...

Forgive me if I'm wrong here, but surely the desktop _does_ reload the accessories if you change between medium/low res? - it doesn't reload the auto folder stuff, so it's not a full reboot, but I've always thought that it had to reload the accessories. It certainly needs to reload the desktop.inf file, which means changing floppy disks over whenever you want to change resolutions, which can be a pain.

No way will I change! Perhaps if someone brings out a "Falcon on a board"
for the TT, I'll add that.
At work I use PCs, Macs, even a Sun Sparcstation - and my TT at home is
still the fastest way I know of producing graphics for presentations, text,
pretty graphs of statistics, etc.
If only MultiTOS would appear (or just effective task switching)... The
idea of Calamus SL, Redacteur 4, Outline Art, and Easydraw (yes!) sitting
together ...

|> > [...] The result is an artificial high number printed as 'bus speed'.
|> >
|>
|> The quickest way to settle this is to know some facts:-

Yep. Now let's examine your 'facts' a little bit...

|>
|> The Falcon 030 is known to be capable of displaying approx 880x620
|> 8-bit pixels @ 61 Hz noninterlaced. Since that requires a bus speed of
|> at least 32 MB/s, it would seem that Howard Chu gave a pretty

|>
|> Now for the benefit of expediency, assume that 32 MB/s is 100%
|> of the bus bandwidth of the Falcon.
|>
|> For the programmer who is creating a game using the 320x200
|> 8 bits/pixel mode which takes up about 4 MB/s, that would
|> mean 28 MB/s is available for the CPU and blitter.

Problem here: people we talking about the speed at which the
Falcon's 68030 with a 16-bit data path to memory could access it.
You can have a fast bus, but still you'll be limited by the CPU.
Your arguments only mean that the 68030 will face no bus contention.

|>
|> Note that 28 MB/s available in the Falcon is 400% more
|> bandwidth than the A1200/A4000's Chipbus bw of 7 MB/s!

The Amiga 1200 has no bus contention with 320x200 in 8 bitplanes
either.

|> But the greatest advantage the Falcon possesses over the
|> Amigas is the chunky-pixel architecture, because it
|> allows the programmer to accomplish in one memory access,
|> compared to at least eight accesses of the Amiga bitplanes.

OK, let's stop here for a moment. There is a way on the Amiga
to move the 8 bitplanes with one blitter access. All you need
to do is construct a copperlist in such a way that you change
the bitplane pointers to point to the next 'memory line', arranging

the memory also in such a way that data is in the following format:

```
bitplane #0, y=0 0000000000000000
bitplane #1, y=0 1111111111111111
.
.
.
bitplane #7, y=0 7777777777777777

bitplane #0, y=1 0000000000000000
bitplane #1, y=1 1111111111111111
```

etc.

In this way, the blitter requires to access the memory only once
for moving a 'software sprite' or bob. Now, the Falcon BLiTTER (TM)
has one problem: it allows only one source, and destination while
the Amiga's blitter allows two sources and destination. This means
that for making 'cookie cut' bobs, the Amiga's blitter has to do
one operation, whereas the Falcon's blitter has to do 3 operations
(someone proved this a while ago).

This actually makes the Falcon BLiTTER (TM) 3 times slower, if
we assumbe that both run at the same speed in their performance.

Also, there is an advantage for games in a 'bitplanes' architecture
like the Amiga, as it is very easy to create 'transparency effects'.

```
|> The 800% advantage of the Falcon's chunky versus the
|> Amiga bitplanes *combined* with the 400% advantage of
|> the bus speed means the only one thing: the Falcon 030
|> has a graphics performance "envelope" far beyond the
|> Amigas and many other systems on the market.
```

False, read above. Also in the case of games, you are disregarding
the Amiga's AGA 16 color, 64 bit wide HARDWARE sprites which
take no time at all to move, and this allows blows your claims
of Falcon's speed away (for arcade type games). And we are not
still mentioning Dual-playfields, which is something that the Falcon
will just can't do... not even I have seen a 486DX2 66Mhz doing it so
far.

Further proof against the 'graphics performance envelope far beyong
the Amigas' claim, is when it comes to animation. Making real time
animation on the animga is a snap with the Ham modes. They allow for
a lot of speed since they use 6 or 8 bitplanes and can show over
256,000 colors at the same time (HAM8 mode only- 8 bitplanes). In
contrast, the Falcon's 'true color mode' will not have the same
capability, as you need more memory to move.

```
|>
|> The absolutely surprising aspect of the Falcon 030 is
|> that Atari could scale it up to a full 32-bit machine
```

|> running at 32 Mhz and simply blow every other PC 486
|> and Mac Quadra off the planet!

You are going too fast... think again.

> Spot the difference?
>
> Your eye can see approx 40 intensity levels for each of Red, Green and Blue.
> Now lets say we have a super person who can see 50 levels for each of Red,
> Green and Blue.
>
On a PC, we have 128 grey levels. It is easy to see the boundaries between
adjacent grey levels (i.e. 100:100:100 -> 102:102:102)
therefore our eyes must be able to detect more than 40 levels of either
red, green or blue Also, as you're british, one of the ray-traced sequences
at the beginning of a news program (BBC1, I think) has a light blue ball
in it. I think it could be the earth, but I'm not sure. The boundaries on
this are also distinguishable, and I believe it was traced in 24 bit!
tho whether it was stored as such, I don't know.

> 50 x 50 x 50 => 2500 x 50 = 125,000 colours.
>
> Thats still only half as many as 256,000 colours, and thats for an above
> average person.

I don't think so. I have normal vision.
Another point is that human vision recognises colours that aren't possible
to display on normal RGB or CYMK systems. I find it difficult to explain,
but two of the sensors, I think red and blue, give NEGATIVE signals to the
optic nerve. For instance, if you look at an ultra-violet light, or a
Halogen floodlight, you will see a purple ring surrounding the light.
This is a portion of the spectrum which is picked up by the blue rods
in our eyes as a negative signal, It cannot be reproduced on a monitor.

> The real point is:- Are these 256,000 colours evenly spread? If they are then
> you won't be able to see all of the colours. If they aren't then it may be
> that part of the colour spectrum we see is not represented properly by the
> Falcon colour pallette, in which case you will be able to say it isn't
> true colour. That said, you can use the very same argument against a 24 bit
> card.
>

Good point. Even on an Amiga with 4096 shades, there are yellow/green
shades which are almost indistinguishable, but if you look at dark shades
of red/blue/grey the boundaries are blatant.

Finally, if you look at a good Optics book, it will probably state that
there are about 2,000,000 shades distinguishable to the human eye
therefore 256K colours is definitely not adequate, even if they are
evenly spaced.

Sorry this is mailed, but I don't seem to be able to post. If possible, could
you please cut/paste this message and post it on my behalf?

thanx in advance...

2853. Problems compiling MiNT0.99

Newsgroup: comp.sys.atari.st
Date: 1993-02-16 14:36:29 UTC
From: thiele@quando.quantum.de
Message-ID: <1993Feb16.143629.3907@quando.quantum.de>
Source record: 210043

Hello everybody,

I found MiNT0.99 on our local FTP server some days ago and tried to
compile it onto my Atari (MEGA ST, 4MEG, TOS1.2(sorry)).
Things seems to be ok, but then then the assembler tries to assemble
the special ".s"-files (transformed from the ".spp"-files)!
Trying this, the assembler cries "Oh no!" when he finds commands like
"pmove" and "rtestr" and similar stuff (68030 assembler??).
Is it impossible to compile MiNT0.99 on a 68000 processor? There are a
lot of comments to the 68000 in the source code, so it should be
possible, but the assembler refuses to compile this files.
I use the Gnu Compiler 2.3.1 with GAS 1.38 patchlevel 4.
I hope someone can help me.

Thanks in advance

Holger

> John Hauser---jhauser@cs.berkeley.edu YYYYYYYYYYYYYYYYYYYYYYYYYYYYYYYYYYY

I don't know if I've got the same thing you've got, but I have an ICD host adaptor that gets its power from the SCSI drive - it's the same adaptor used to fit an internal hard drive in a Mega case, all I've got is an ACSI cable attached to it. It's a small little thing that plugs directly into the back of the drive. It works great. Not sure if this is pertaining to your problem...

Hmmm... I was under the impression these new Macs don't use standard _Mac_ SIMMs but rather make use of the kind normally found in pc's. This may hack off current Mac owners who have Mac SIMMs to swap but should make SIMMs for the new Macs even easier to find.

> - I don't know about it's internal video, but the video on the LC, LC II

> from this as well, but all it will be compared to is the STE, TT,
> and the Mega, so it should come out ok. Plus, the Falcon seems to
> be designed to keep video rolling quickly...but we'll see).

Yep, Macs using internal video have always been slower than if they use a card. It's the price paid for a "plug & go" system. Be forewarned, however, that the 256 color mode of the Falcon is _noticeably_ more sluggish than the 16 color mode.

No doubt about it, the new Mac line definitely sets a new price standard for Apple with Color Classics retailing for <$1400 complete and this LCIII going for <$2500 retail complete with monitor and keyboard. Whether they will compete with the Falcon is still to be seen, however. I don't think Apple is worried. ;-)

I think you are wrong about Bob Brodie. It's too bad if he came off arrogant
to you at the Glendale show (perhaps he felt he was being attacked too?) as
he really is one of the few real friends we (users and devs) have at Atari.

Bob Brodie has _no_ authority to influence how Atari markets their products.
If you don't like the way Atari handles their marketing (who _does_ like it?)
then don't get mad at Bob. Brodie's semi-official position is to act as the
"whipping post" for Atari. He makes the public appearances and takes the
heat for Atari. Not a very enviable job. He is human, however, and has said
some things that really ticked me and a lot of other folks off. Perhaps you
just caught him after he was royally (and unfairly) flamed by some idiot who
took it upon himself to personally blame Bob for ALL of Atari's woes. Stupid.

Again, it's too bad you got turned off by Bob Brodie as he is _not_ the real
enemy here. Believe me, there are plenty of other folks at Atari who are
well deserving of our amassed ire!

>
>Hi. I was just wondering if anyone could reccommend any good GIF viewers
>that are available via FTP... [stuff deleted]

Gemview 2.13 and Photochrome 3.0 would come to mind (both available at
atari.archive.umich.edu). Gemview handles a bunch of formats, and will take
advantage of any special hardware you may get (Crazy Dots board, etc).
Photochome will produce the best results on a stock ST/STe system...

Photochrome, while obviously not nearly the resolution of say a VGA
system, would give results that are quite pleasing to the eye (and
would use ALOT more colors than the older GIF viewers)...

>I'm told
>the ST (mine's a 1040 with no modifications) isn't really compatible with
>the GIF format

You were told wrong. I believe the whole purpose behind GIF was to make
it available to all computers (Graphics Interchange format?). All a GIF is
is a file - all someone has to do is write a program to handle that file -
ditto with any other picture file, sound file, word processing file, etc.
A file by itself does *not* limit who can handle it - it's up to someone
to decide to handle it (yes, you can use GIF's with even Atari 8-bits,
C64's, and ANY other system who someone has written a viewer for)...

Hope this helps...

Any Mac with 2 megs of Ram can run System 7. (Although I wouldn't
recommend it on a Mac plus. I have used it on a Mac SE (no 30) and it
doesn't feel all that bad. I alsowouldn't recommend only 2 megs of Ram
either!!)

I run System 7 on my PowerBook 100, and I have no difficulties
whatsoever.

> - Lattice C V5.5
> well done compiler, good libs, small execs
> *but* commercial product (cost around 400,-DM -> US$ ~275)

I can also recommend Pure C, which is about the same price as Lattice C.
The manuals and online help are in german (although the menu system and
error messages are in english), but don't let that stop you, only a limited
german vocubalary is necessary, and if all else fails you can always use
standard ANSI C reference books for most of the library and language.

> MK> While we're at it - anybody know of a decent resoucre editor to use with
> MK> C and other .RSC files ?
>Lattice includes an Resource Kit (WERCS) or you can get a very good shareware
>Resource Kit (ORCS) at a.a.u.e. (I think). Shareware fee is about 50,-DM (US$
>~35).

I wouldn't recommend WERCS. I bought it as an upgrade from a resource editor
I had that came with Mark Williams C, but in fact it wasn't much of an
improvement, and it has at least one serious bug (it can't remember the name
of image objects). Hisoft, the distributor of WERCS wasn't exactly helpful.
when I wrote them about the bug. Moreover, it was quite clumsy to use.

Instead I would recommend Interface, a program from the german company Shift.
It is much nicer and faster. Again, this program has a german manual and
german menus, but since its use is quite obvious you don't need the manual
very much, and you'll probably be able to guess the meaning of most menu
entries. Moreover, all technical terms of resources have been left untranslated,
like SELECTED, CROSSED, DISABLED, etc.

>
>If Atari can get the Falcon on the market in March, than it would have beaten
>the new 14 inch color classic that is power pc ready by one month(April
>release)...Wow!!!!!!!!!!

Not to mention be up to 200% less. The Falcono030 LISTS for $799. Street price will no doubt be at least $100 lower than that. You can get a 2.5" 85mb Maxtor internal IDE HD for under $280. MUCH lower than the mac. It will also run any type of monitor from TV to SVGA right out of the box.

And here's the kicker, Byte magazine (Jan, 93) actually gave it a very good review. Not bad, hu? It wasn't even biased, only honest; "Considering Atari's track record, one can't help but be skeptical. However, the Falcon really is something different." Not bad, hu?

Now, if Atari's management can catch up with their development....

I have to agree with that,

I ordered a PC720B (3 1/2" External drive) for my Atari, they sent a PC880B (amiga drive). I also got an ICD link with German software and an English manual.

But when they sent the PC720B again, it was faulty. So, as I had held onto the PC880B until my 720 arrived I swapped mechanism's from one box to another and it seems to work ok, but I'm not totally convinced.

The ICD link seems to be ok but I would like an English version of the software so that I can see exactly what I'm getting.

This is true only for the IIsi and IIci which used a cycle-stealing DRAM approach. The LC, Centris, and Quadra machines all have VRAM-based video which actually provides higher performance than a (non-accelerated) video card.

There used to be a reason for doing this, when floppies were expensive.
Now, keeping bad floppies is just stupid, they're so cheap now. A good
formatter will tell you immediately of a write failure, and you then
should proceed to frisbee the disk.

You're missing the point, I think. For people who *already own* a GCR,
it would be nice to be able to use it on a Falcon until Gadgets comes
up with something else. A lot of people might really want a Falcon, and
for reasons other than just running GCR. Some might want to sell their
ST in the process, so they would want to do everything on one machine.

I think you are confusing marketing terms with real definitions. I think it is unwise to base definitions on marketing terms. One of the best examples is the term PC. Before, it used to mean personal computer but now it has come to mean an IBM clone. Does that mean that the Amiga, ST or Machintosh are not PCs?

One should take marketing terms with a grain of salt.

Anyway, having said that, I decided to do some research. I looked through my old issues of Byte and I found something interesting.

In the March 1987 issue of Byte (page 215), they have a review of the first TARGA boards. The board reviewed was the TARGA 16 board. Guess what? It offered a non-CLUT (Color Look-Up Table or Palette) display with 16-bits per pixel. Each color component (red, green, blue) had 5-bits each, giving a total of 32,768 = 2^15 colors.

There was also a TARGA 24 board which offered a non-CLUT display with 24-bits per pixel. This board was not reviewed however.

In my opinion, this seems to actually support Atari's use of the term true color. And as I've said before, I like this definition. I think it's more elegant to say 16-bit True Color and 24-bit True Color than to say Hi-Color and TrueColor. Why invent a new term when you don't need it?

Finally, this definition is very logical. The bits of the pixel represent the 'true color' of the pixel as opposed to being an index into a CLUT.

According to Jerry Pournelle, there is not such as a SIMM 'normally' found in PC's ... take a peek at his Chaos Castle article in the February (? the one with the newsbyte about the Falcon030) issue of BYTE. Different boards take different SIMM forms. He was less than enthused about yet-another-difference between 'standard' PC motherboards...

The other big thing is that musicians can buy a Mac locally, unlike
an Atari. I had a friend asking me what computer to get to start doing MIDI
work. I naturally recommended a ST, but then he askedwhere he could go see
one and get a demonstration. Well, there isn't any dealer in the Cincinnati
vicinity. In fact, I don't know of any dealer where I could go to to
purchase Atari hard/software. Anyway, to make a long story short, I
told him to go check out the Macs.

Hmmmm, really? Well, I admit I haven't examined the internals or the schematics but the cartridge port on my Falcon looks amazingly like the one on my MegaSTe. I think they are the same, Steve, but of course, that doesn't mean the old ST carts will work on the Falcon as is. As you know, the Spectre GCR does not.

>Buying a Falcon just to run Spectre GCR on it would be pretty dumb

This is true, but we need to run the argument a bit further still. With the introduction of the new "el-cheapo" Color Classic and LCIII from Apple, one must also question the viability of a "Spectre 4.0" color capable Mac emulator from a cost standpoint. Still, it would be cool to run color Mac apps on the Atari, eh?

>

You should contact the maker of the external drive. It may be as simple as setting a jumper inside the box. There is usually a jumper on the hard disk itself that determines whether the termination power line is driven or not.

> 'ugly' and they are WRONG. It doesn't matter how many people
> think something incorrect or use something incorrectly--they
> are still *wrong*. Period.

Quite simply, you are wrong.

1). Words do not have God-given "intrinsic" meanings. Their
meaning is defined entirely by usage; that's why words change meaning over
time, and that's why slang such as "chill" still works to establish
communication, even though the slang meaning has little relation to any
dictionary definition. Language is not stagnant, as much as that would make
life simpler for some folks. Words mean what they are used to mean *now*;
older meanings are archaic, and any particular word will probably mean
something different later. Who controls that? *We* do, not dictionaries
or legal edicts.

2). Companies and governments have no more power over the meaning of
words than do dictionaries. Thus, if you ask someone for a Kleenex, they
won't look around vaguely and tell you that they don't have one when a box
of Softouch paper tissues are at hand; nor will a coworker glance at you
blankly when you ask them to xerox something for you, and your copier is
a Canon copier. Communication is established regardless of how much Canon
may complain that Xerox is a company's name, not a verb, and communication is
the only reasonable measure of the meaning of a word.
Words are perhaps our most democratic...and anarchic...institution.
We all vote on what a word means whenever we use it, and we may, through

esoteric processes, all choose to change that meaning at any time, for any reason, under any circumstances, without going through any kind of formal/legal process.

3). A peculiarity of language is that it is perfectly possible for a word to have two or more meanings. Folks that argue that since a word means such-and-so it therefore cannot mean anything else are ignoring that simple possibility.

4). I'm not positive about this, but I believe that the TrueColor trademark has a peculiar spelling/capitalization scheme (either what you posted above, "TrueColor" or "TruColor") and is one word. If so, then there isn't even a legal claim to a meaning of the words "true color" (not, as I pointed out above, that legal claim would have any effect on the true meaning of the word).

5). Lastly, you're arguing about a "marketese" word in the first place. Jeez, it's the advertisers job to convince you that Retsin is a miracle drug. I wouldn't be surprised if the words with the shortest halflife of sharply defined meanings are those being warred over by advertising executives...

Hi !

One of my users has a problem. It would be great, if some of you could help him. His netadress is: Lars_Borghring@hh3.maus.de

---------- And here's his text :-) ----------

I am an Psychologist from Sweden. I've an assignment from the Handicap-Institut of Sweden to get programs of interest for the Autistic Children. The programs should be for fun and entertainment only. There is no pedagogical approach in the first place, It's for entertainment and stimulation. (If you get stimulation, you also get some pedagogical results). So, It's games I want, Games that can be configureted for individuals needs. They must be very 'clean' in the display, Autistic children needs to have it like that, or they get overwhelmed by the stimuli. The games can be in GFA, Stos,Amos, C or even in assembler. I can get get them transleted an d reconfigured. There will be some money involved. If the games are usable, I'll pay 200 DM. If they then get widespread among the handicaped institutions you'll get an extra fee for each copy. My name is Lars Borgh, Adress: Jaernvaegsgatan 32, S-62146 Visby Sweden. Phonenr: +46 498249798, Get intouch, please!

(I know someone out there is gonna make me eat my words on this topic, but anyway...) It would be a nice idea to let MiNT know if the FPU is real or being emulated, so it can know whether or not to save/restore the FP registers on a context switch. Ideally, there would be a way to trap all FP activity, so the OS can ignore the FP registers if the current process doesn't use them. (Right now, if MiNT sees that an FPU is present, it will always do a save/restore on every switch. If the current process doesn't use any floating point instructions, then one set of save/restores can be omitted.) In a software emulator, the FP registers have to be faked in normal RAM anyway, so they might as well just operate directly out of the process' register context, thus also eliminating a save/restore step.

That would be 32MB TT and 10MB ST (8 exp. + 2 onboard) = total 42 MB
(I 'only' have 24MB (20TT/4ST))

>How do all you other TT owners feel about Falcons? Planning on upgrading
>(or is it downgrading???)? Should I stick with my TT and just buy a funky
>Crazy Dots VME card for better-than-falcon graphics? Wait for an 040?

I'd buy a F030 right now (it's available for me right now) but I feel the
price is not quite right for the moment. I would howewer not sell my TT
until I could replace it with a 68040 based Falcon. The TT is still a much
more capable machine when it comes to serious DTP and wordprocessing (due to
the VERY good 1280*980 19" monitor). And you just don't want to drop down to
640*480 in a MiNT/MTOS - GNU (gcc) programming environment when used to
1280*960 alowing for some 2 80*24 character windows with bash or tsh, and a
90*100 character window for emacs (the 'real' one, not micro-emacs), and of
course a few directory windows. All this with almost no overlaping windows.

Of course it would be nice with some colors, but I don't realy miss it that
much I want to pay a $1000 extra to get the sam rez and quality in colors!

BTW. My plans for the F030 I surely someday will purchase is to use it in my
stereo as a 4 way active filter to drive my 4 way speakers. One amp. for
bass, one for lower midrange, one for high midrange, and one for the
tweeter. I already have the setup, but with a analogue 4 way active
filter:-)

PS. And i might also play some games on it.....

Be ware of serious bugs in some of the 68030 spesific libraries of
Lattice 5.5. I have not tried to trace them down, but when MiNT 0.99
was compiled with 68030 omptimation, it became REALY buggy. Turning
off the 68030 optimation removed most of these bugs!

|> For the programmer who is creating a game using the 320x200
|> 8 bits/pixel mode which takes up about 4 MB/s, that would
|> mean 28 MB/s is available for the CPU and blitter.

Problem here: people we talking about the speed at which the
Falcon's 68030 with a 16-bit data path to memory could access it.
You can have a fast bus, but still you'll be limited by the CPU.
Your arguments only mean that the 68030 will face no bus contention.

|>
|> Note that 28 MB/s available in the Falcon is 400% more
|> bandwidth than the A1200/A4000's Chipbus bw of 7 MB/s!

The Amiga 1200 has no bus contention with 320x200 in 8 bitplanes
either.

|> But the greatest advantage the Falcon possesses over the
|> Amigas is the chunky-pixel architecture, because it
|> allows the programmer to accomplish in one memory access,
|> compared to at least eight accesses of the Amiga bitplanes.

OK, let's stop here for a moment. There is a way on the Amiga
to move the 8 bitplanes with one blitter access. All you need
to do is construct a copperlist in such a way that you change
the bitplane pointers to point to the next 'memory line', arranging
the memory also in such a way that data is in the following format:

bitplane #0, y=0 0000000000000000
bitplane #1, y=0 1111111111111111
.
.
.
bitplane #7, y=0 7777777777777777
```

bitplane #0, y=1 0000000000000000
bitplane #1, y=1 1111111111111111

etc.

In this way, the blitter requires to access the memory only once
for moving a 'software sprite' or bob. Now, the Falcon BLiTTER (TM)
has one problem: it allows only one source, and destination while
the Amiga's blitter allows two sources and destination. This means
that for making 'cookie cut' bobs, the Amiga's blitter has to do
one operation, whereas the Falcon's blitter has to do 2-3 operations
(someone proved this a while ago).

This actually makes the Falcon BLiTTER (TM) 3 times slower, if
we assumbe that both run at the same speed in their performance.

Also, there is an advantage for games in a 'bitplanes' architecture
like the Amiga, as it is very easy to create 'transparency effects'.

|> The 800% advantage of the Falcon's chunky versus the
|> Amiga bitplanes *combined* with the 400% advantage of
|> the bus speed means the only one thing: the Falcon 030
|> has a graphics performance "envelope" far beyond the
|> Amigas and many other systems on the market.

False, read above. Also in the case of games, you are disregarding
the Amiga's AGA 16 color, 64 bit wide HARDWARE sprites which
take no time at all to move, and this allows blows your claims
of Falcon's speed away (for arcade type games). And we are not
still mentioning Dual-playfields, which is something that the Falcon
will just can't do... not even I have seen a 486DX2 66Mhz doing it so
far.

Further proof against the 'graphics performance envelope far beyong
the Amigas' claim, is when it comes to animation. Making real time
animation on the animga is a snap with the Ham modes. They allow for
a lot of speed since they use 6 or 8 bitplanes and can show over
256,000 colors at the same time (HAM8 mode only- 8 bitplanes). In
contrast, the Falcon's 'true color mode' will not have the same
capability, as you need more memory to move.

|>
|> The absolutely surprising aspect of the Falcon 030 is
|> that Atari could scale it up to a full 32-bit machine

Yeah, I get pretty bigoted about this sort of thing too, but I've come to
accept the fact that not all intelligent people are devoting their lives to
computer science or engineering, and there really is a place in this world
for a computer that hides the details of computing from the user.

But it sure ain't for *me*... To me, computers and programming are an
inseparable notion. Using a pre-written application only occurs to me when
I want to play a game. (And even then, I spend a lot of time tinkering to
see how it's written...) I could never just turn on a machine, start up an
application, and use it without ever wondering what's going on inside. With
a Mac, it's almost impossible to find out what's going on inside. It's also
a somewhat expensive proposition to set up your Mac so you can develop your
own code on it. So expensive that very few people ever actually take that
step, to learn about what "real computing" means. For this reason, I will
never consider a Mac to be a "real computer" no matter how new and large
and cumbersome the Mac "OS" becomes.

Meanwhile, the Atari ST has always been a programmer's machine. Unlike the
Mac, which at its introduction didn't even have enough memory to run its
own development system, the ST has always had a wide variety of programming
tools available for it. With all the GNU utilities currently available, it's
also guaranteed to have a state-of-the-art programming collection for its
entire lifetime.

A good point and quite possibly correct. Is it not ironic that Apples stock
price and "analyst's recomendations" are going up *because* they have a
truly enormous backlog of unfilled orders!! They have the absurd situation
where some machines, like the IIvi (and possibly the IIvx as well) will now
be obsolete *before* most of the backorders for them are shipped... And
some of us are keen for Apple to reduce their prices still further, good

God if they do that the demand will explode and we'll never get any machines!

Maybe Apple can buy all Compaq and IBM's manufacturing plant to increase their production capacity (and buy Toshiba's to help the PowerBook shortage) :-)

The best things in life are not free - they are on backorder!

>Did Speedo hog the system (ATM on my '486 at work hogs the system...)?

MultiTOS wasn't there.

One guy who uses Microsoft Works said AtariWorks looks better. Did it
hog the system/RAM? From where I was sitting (in the audience), it didn't
look like it, but what could I tell you? :^) Another thing, I don't know if
I should tell you :^), but you can insert digitized sounds into an AtariWorks
document, and replay it later by clicking on the icon representing it. AW
imports and exports RTF files.

I don't know how much Speedo "hogged" the system, but it was VERY, VERY fast.
They had a 4meg Falcon there, with SAM installed, 70 Speedo fonts,
Atari Works... It all fit. Speedo + AtariWorks is supposed to sell for
$129, for current owners. When it's ready, it's going to ship with the Falcon.

In article <C2IJv9.EtA@news.iastate.edu>, Marc N. Barrett (barrett@iastate.edu) wrote:

No holds barred.

: It's not that I'm lazy, its that I can't afford to get started. I would
: first have to purchase a new Amiga, then an update to my C compiler, then the

Better people than you have programmed good software on a 500.

Updating software is the cost of owning a computer. If this was your
precious WP getting an upgrade, you'd be complaining a lot less.

: RKM manuals, then send CATS $100 to renew my developer status, then get some

Screw the RKM's. They're nice, and they're pretty, but they're
UNNECESSARY. All you need is example code and the on-disk autodocs.
Which are even nicer once you "Guide" them.

100 bucks may seem like a lot, but if you want the information. Scratch
that. In this world, when you want ANY information, you pay for it. A
good architecture book costs, on the average, 60 bucks. That's about how
much I paid for H&P. In perspective, 100 bucks ins't that bad.

: more programming books, then the new AppShell/AppBuilder utilities (what
: was it called? Too-something), etc. I could easily spend $3000 just getting

One does not need programming books to be productive in programming.
It's great if you need your hand held, but example code can do a world of
difference. If you need example code for 2.04/3.0, that's what programs
like TERM 2.4A are there for--to learn from.

And AppShell/AppBuilder/ToolMaker/GadToolsBox are entirely unnecessary
for the kind of programming you'd be doing. Sure, they're nice, they're
pretty. But they're frills, and you can DO the programming without
them. GadTools is _NOT_ difficult AT ALL. It's actually very simple.
BUT making things look pretty isn't always easy. That's one reason
those programs exist. Another is that for large, complex programs,
gadgets can be a difficult thing to deal with.

: started in Amiga programming again. I'd rather spend the money to keep
: living in my apartment for another year.

I don't CARE what you'd "rather do". However, your bitching and
complaining leads one to believe that you're "unable".

Bullshit. Upgrade your compiler, if you've got SAS 5.10, it's 100
bucks. If you're buying it new, get it on student discount. Send C= the

100 bucks to become a developer.

That's all it takes. 200 bucks. If you can't afford that, that's just fine. But don't expect sympathy--that's cheap. You pay more than that for software on other systems, a small price to pay to be able to create your own.

Greg

>good guess of the CPU-memory speed.

Don't forget that the bus from memory to video logic _is_ 32bit while
the bus from memory to CPU is _16_ bit.

And 880x620x61 is not possible on the Falcon. It is more like 768x480x60
for a 640x400 base image with 20% overscan (it maybe even less). With
32bit accesses you get then about 22MB/s total bandwidth.

So for the CPU you have about 11MB/s if there is no contention with the
video system. This is reasonable for a 16MHz 68030 that does a 3 clock
cycle (standard aysynchronous accesses) on a 16bit bus (which would give
exactly 10.666MB/s).

>interface port and its serial ports. The Falcon 030 has a serial
>port (similar to the NeXT but with more control signals) that is
>capable of 1 MB/s transfers.

If that is the DSP56001 synchronous serial interface then you can
use it for up to 8MBit/s -> 1MByte/s. If that is the serial communications
interface you can use it for 4MBit/s in synchronous mode and 500kBit/s
in asynchronous mode.

Interrupt overhead will usually reduce these figures.

>The DSP in the Falcon has its host port memory mapped so it would
>be reasonable to expect that the 8-bit port would be capable of
>at least 8 MB/s transfers. Anyone familiar with the 56001 specs
>know for sure?

The port is specified for up to 8MByte/s but this is only usuable with
blind copy loops. If you want to transfer using interrupts you drop
down to about 2.7MByte/s on a 32MHz DSP56001. But then, a 16MHz 68030
can only push data bytewise at 5.3MB/s, so the 8MB number is illusoric
for the Falcon.

2903. NeoDesk 3.03 improvments

Newsgroup: comp.sys.atari.st
Date: 1993-02-17 01:19:53 UTC
From: phruby@ucrengr.ucr.edu
Message-ID: <26212@galaxy.ucr.edu>
Source record: 210094

```
What's New for Version 3.03
===========================

o When a folder is opened, the position of the window scroll bars are
saved. When the folder is closed, the old scroll position is restored.

o A "Delete Item" menu option has been added. This makes it easier to
delete things when the trashcan is not visible. Please note that this is
a permanent deletion; the Recoverable Trashcan is not used.

o Show Information works for multiple items on the desktop or in windows.
If no item is selected, the topmost window's info is shown.

o Pressing Backspace will do the same thing as the "send to back" button on
the topmost window.

o High and Extended density floppy formats have been added. In order to use
High Density, you must have a 1.44Mb drive and the proper version of TOS.

o The "Fast-11" disk format has been added. This is optimal for 9-sector
disks. Twister is still best for 10-sector ones.

o The "Set Preferences" dialog has been changed cosmetically. Also, a
"More" dialog has been added:

o If an error occurs while files are being copied, then any files which
are in memory but have not been written to the destination disk can be
automatically moved to the File Clipboard. The "More" dialog contains
an option which specifies whether to Ask before doing this, to Always
do this, or Never to do it at all.

There are times when this will not be possible, though. If there is not
enough free memory in the system, then the files will not be stored.
Also, any file which is only partially in memory will not be stored.

o The Format for Diskcopy is what is used when copying from one floppy to
another, with the "Format" option.

o If "Check for Executable Bootsector" is off, no virus check is
performed. This makes updating drives significantly faster on machines
that use AHDI with a Syquest drive.

o If "Check for Bad Filenames" is off, no check is done to see if you
have entered bad characters for the name of a file. It also converts
the names of files to all uppercase before matching icons. Having this
option off is slightly slower at re-reading disk drives for this
reason. If you use DMJ's ReNameIt program, you must turn this option
off.
```

o The INF files option in Set Preferences has changed. It now controls whether or not VDI graphics are used for a particular resolution. If the button under "VDI" is blackened, then when NeoDesk first runs, it will load a different set of graphics routines from the ones it normally uses. The VDI graphics mode must be used with extended graphics hardware (like the Matrix and Crazy Dots video boards), and also the True Color modes of a Falcon. Also, if you use a screen accelerator program like Warp 9 from Codehead Tech., you will see a greater speed increase when NeoDesk is in VDI mode.

In this dialog, you can also enter the name of a default INF file to use if no other INF file is appropriate for a previously undefined resolution.

o NeoDesk can control the caches of a TT, Mega STe, or AdSpeed, as well as the Blitter. If you load a NeoDesk 3.02 INF file (with INF_CONV), all of the new caches will default to On. These chips can be configured with the new version of NEOCNTRL. Any changes made in NEOCNTRL are saved when you Save Configuration.

o In addition to the hardware flags described above, each Installed Application can also be set to turn the corner clock off. Note that if the corner clock in NEOCNTRL is already off (or NEOCNTRL is not loaded), changing this flag will have no effect. For that matter, setting any of the CPU flags for an application when the machine you are using does not have that capability (like turning the Blitter On when all you have is an original 520 ST) will have no effect, either.

o NEOCNTRL has the ability to change the sound controls on a TT or STe. Please note there is no way for the control panel to know what the current settings of these controls are. This means that if you use Atari's XCONTROL to change the sound controls, then NEOCNTRL will reset them to whatever values it last had when you open the sounds dialog a second time.

o When the mouse is over an icon in NEOCNTRL, a helpful string of text is displayed in the name bar of the window.

o The corner clock is now always turned off when viewing a picture or a text file.

o If the Control key is held while double-clicking on a file on the desktop, a window will be opened to the path of the icon.

o You can now specify a number of copies to make when copying from one floppy to another. Note that if more than one swap is necessary, the source disk will be re-read each time; otherwise it will just be read the very first time. An alert will prompt you after each disk is copied. This alert even occurs if there is an error during copying, though if the error happened during reading the source disk, the entire source will be read again.

o Print Directory's output can be sent to a disk file.

o All window colors are taken from the system's window attributes on a machine with AES versions greater than 2.0. This is only read when NeoDesk first runs, so changing them with the control panel will not affect NeoDesk unless you quit first (or run a program with Unload for Execute on). Also, if you do not have version 4.0 of the AES (MultiTOS), you must run NEOLOAD in the AUTO folder in order for the colors to be set properly. This is due to a deficiency in version 2.x/3.x of the AES.

o Macros can now record opening a NeoDesk desk accessory. This was just an oversight, since they always could record passing files to one.

o If a macro is being recorded while a new MAC file is loaded, macro recording will not stop. Instead, you will be presented with an informative alert. At this point, you should end macro recording, since anything coming after this will be ignored when the macro is played back, anyway. This change makes it possible for a macro to load a new macro file.

o If the right Shift key is held, icons will never become de-selected. This is handy for repeating an operation without having to select the icons again.

o There is now a hack to make it work with MultiGEM, but it still isn't great, due to limitations in MultiGEM.

o NeoDesk works with MultiTOS now, however it really does not take full advantage of its capabilities. Wait for NeoDesk 4...<smile> See the section below for more info.

o If no INF file is loaded and a HD floppy drive is used, the seek rates of both floppy drives are set to 6 ms.

o When editing a Desktop Note, some helpful text appears in the menu bar to remind you of this change in modes.

o If only some of the desktop icons are selected, Snap to Grid will only snap those icons.

o A quicker Show Info is available for disk drives. If the left Shift key is held, the total number of files will not be checked. This is much faster for when you just want to know how much free space there is.

o Files on the desktop can be copied.

o A "No Format" diskcopy will work if the number of sectors per track on the destination disk is greater than that on the source disk. This means you can copy a 9-sector disk to a disk which was formatted to 10.

o Pictures can be displayed in all (built-in) resolutions on a TT.

o NEOCNTRL can also be run as a program, simply by renaming it to NEOCNTRL.PRG. You will not have access to the screen saver or corner clock, though.

o If no environment variables are supplied, then the environment which was inherited from the program which ran NeoDesk is used when NeoDesk runs a

program.

o Show Info for files allows you to set the TT-specific and MultiTOS-specific flags for an executable file.

o If a dialog would have appeared even partially off the screen (due to being loaded with INF_CONV, etc.) it is moved back before being drawn by NeoDesk.

o The memory display in About NeoDesk tells how much free ST and TT RAM there is (if there is any TT RAM). If there is none, then it tells the total amount of ST RAM there is. (There is no way to know how much TT RAM there is total, so it can't be displayed.) Also reported is the total number of free memory blocks, and the size of the largest block (which is what NeoDesk used to report as "free memory").

o The font converter, FONTCONV.NPG, can be used in VDI graphics mode, however it is much faster at redrawing the screen when NeoDesk is in its normal graphics mode.

>ST magazine, btw...)

I've always wondered what the alternative is. What doies the Amiga do when
you select a different resolution from the desktop?

On the ST, it reinitialises the desktop. When you plug/unplug a mono-monitor,
it automatically warmboots the computer. You can change this behaviour (it's a
system interrupt), but why bother - rebooting is very similar to reinitializing
anyway... unless your computer loads its OS from a floppy disk.

I downloaded the NeoDesk 3.03 patch last weekend, from GEnie. Well all
I can say is that NeoDesk no longer bombs on my TT when I extend a window
to the bottom of the screen, in TT-Medium.

I like the 1.4meg floppy functions. Basically I like NeoDesk.
It also is supposed to be Multi-Tos compatible, there are extra
widgets on the show info box pertaining to M-TOS.

I'll contact Gribnif and see if they'll let me post the patch
to the net.

It isn't a problem.. It's just that the halfpipe is REALLY hard until you
get the hang of it. It took me a long time to figure out how. I thought
something was wrong with mine too.

<message deleted for brevity>

I'll assume, yes I know, that you've tried the Link and it failed.
Since the SCSI spec says the drive is supposed to supply power on
the termination power line, not the host, you could say the drive
has a problem. I know the HP and Sun drives supply the termination
power.

This however does not fix your problem. Since you mentioned warranty
I would recommend taking the drive back to the store where you
purchased it and asking them to supply a drive with the power
on that pin, or modify your drive.

Or you could call ICD at (815) 968-2228 and explain your problem
and possibly let off a little steam.

>as opposed to C++ (as in _Cockeyed_). :) Now that I look closely, however,
>the "C" and "G" fonts look a lot alike on my newsreader too.

Well, both C++ and G++ are correct.

C++ is the name of the language created by Bjarne Stroustrop (sp?);
G++ is the name of the compiler for the C++ language that was written
for the GNU project.

Seeing as how the only other C++ compiler on the Atari is Comeau C++,
which I suspect is a rather uncommon program, it's fairly safe to use
C++ and G++ interchangably.

And no, you definitely can't run it off of floppy, whether it be
called C++ or G++. It won't run with a "mere" 2.5 MB of RAM; it needs
more than that. There's a sufficient set of binary exececutable files
(the compiler, the C preprocessor, linker, etc.) #include files, .olb
(library) files, and the likes that THEY wouldn't fit into 4MB, let
alone any of the software.

It is not difficult to run out of memory with GCC. G++ is worse.
It's really not happy with less than about 4MB to work with.

>

I'll keep my TT, and upgrade it as best I can. I wish the Falcon well, but I don't dabble in sound much. I am concerned about what will happen if suddenly a lot of applications make use of the DSP. (I was kind of hoping for a Falcon-compatible card for the TT, but I was told that the hardware configs are too different to make that possible).

ENOUGH ALREADY!!!

TrueColor does mean 24 bits. It is a trademark of AT&T.

When I worked at Lockheed we developed and marketed a "True Color"
display with 16 bits per pixel. We made and sold it, the government
and IBM bought it. That was back in 1982.

However we seem to be talking apples, and oranges here. If any of
you have ever spent a great deal of time working on monitors you
would know the you CAN NOT REPRODUCE COLOUR PERFECTLY ON A CRT.
I know what's about to be flamed my way, so do it via EMAIL NOT
THE GENERAL DISCUSSION.

If 15 bits is not enough for you say so. Heck right now a selection
of 256 from a pallette of 4096 fits my needs quite nicely. If the
machine does not fit your needs BUY SOMETHING ELSE.

To quote Bill Murray "It just doesn't matter."

People get a life!!!!!!!!!!

Now back to our regularly scheduled flame wars... :)

> I have seen the same problem with my card.
> I now play Chip Challenge.

A nice person told me how Half-Pipe actually works

If you on the first move, hit A at the top, you spin around, now
push down while heading down that side, push up when you start going
up the other side, near the top, hit A again, push down, etc. etc.

Keep doing this, and you eventually end up doing jumps so high you
lose sight of the Half-Pipe, and doing Aerial Turns correctly can
score about 1000 points each time! (I've managed to get in excess of
20000 points so far....)

Also, Rampage, certain people can be picked up, and held, while holding
them, your score rockets up, usually giving you about 20000 points
if you can hold them long enough (before they hit you in the face....)
George, picks up the woman (Someones been watching King-Kong movies)
Larry gets the red guy resembling Mario (who is really a guy in a
red suit with brown brief-case)

etc. Experiment!

Slime-World, while playing the limited games (Action/Suspense), always
hit pause just before you die/the planet melts. You then get the
continue code, and can begin from more or less where you died. (Says
this in the doc's what what the heck 8-)

Over here, we pay roughly $40US for Lynx games! Not cheap at all!
(Luckilly, I got 3 for about $30 from a friend, so that made up for it! 8-)

> tochoose from.)

They are still very expensive! ^R
A mac' at roughly the same spec's as the Falcon, costs twice as much!

as mac-classics is improving, but they don't stand up to the technology
in the Falcon. Also, it doesn't change the fact, that considering
what's inside Mac's, they are WAY overpriced! (Great machines though....)

Mac' software prices are improving, but could be better! (So can
everything else though 8-)

Mose Mac' wants are satisfied in the PD/Shareware these days anyway!
(Apart from high-quality games, of course ;-)

I never have gotten the scoop on these new joysticks...are the buttons arranged in the standard square keypad arrangement? Are there six buttons an each side of the joystick? What?

Has anyone heard what the compatibility of this SpedoGDOS/AtariWorks combo will be for a Mega ST4?

Soundslike a great idea to me, if I could use it.

Doesn't it make you glad to own a computer that has a mouse as a standard
feature? Standard joysticks too. And modem port. Printer port. Midi ports.
Cartridge port. I'm glad there are even MORE standard features in the
Falcon. Standard DSP, new-fangled joystick controller...

>that the A1200 provides for a Fast Ram bus.

The problem with the AGA-chipset is that the A1200 must accsess the chip-
ram on every VBL so altough the pure prosessing is faster with fast-ram
you will probably not see it on the screen since the VBL's can't
be updated in the same speedratio as the calculations. What I'
m trying to say is that even though the A1200 is quite
fast with fast-ram (NOT faster than F030) it's has little practical use in
games and programs that need fast screen-updates. I may have written a bit
of Norwegian-English here, bit I hope you get what I mean. The bandwith-
tests stated in this tread clearly shows my point in 640x480x8bit color,
non-interlazed, the bandwith is 100% saturated. Since the CPU needs 50% of
the bandwith you can figure out for yourself that the prosessor is slowed
down considerably and this mode is a bit slow to use in games which needs a
lot of prosessing-power. BUT there may after a while be programmers that
find a way to speed up this mode with various tricks as there have been on
the Amiga and ST(e) models in the past. Again only time will tell. Great
games like Civilazation and other games like that with few things happening

at the screen at once you will see no slow-down in this mode I think.

The A1200 is quite a good machine it has some features that the Falcon misses, but it's maybe more the other way around. If the Amiga had got a SCSI II port it would have boosted it's DTV greatly and not to mention the 16-bit sound an a standard! DSP. The A1200 would have been a low-cost alternative for semi-professional studios, but now it doesn't mesure quite up since the BIG, Mac price cuts.

The Falcon could have come with a real 32 bit bus, but I firmly belive that the dubbelspeed multiplexer will make up for that. It should also had a 32 bits expansion bus, but this they have gotten around with a hack of some sort, ATonce has under development a 486 card so.. The gaphics could have been better, but then again I have seen the true-color mode and I can say that I don't see any difference between that and 24-bit. At least normal eyes won't see the differnce, but then again I might not have 20/20 vision ;) altough I belive I have.

There have been a lot of stuff said that have not been accounted for and I am no exeption. I have written a lot of provokative remarks, but that's because I thought the discussion was a bit silly since we knew so little about the machines and that many of the amigans wrote a lot of things about the Falcon that was absolute rubbish and spaced out. OK, I thought lets write a lot of rubbish back. This tread is finally were it should be thanks to people like Howard Chu and George Robbins who have the ability to be as objective as one can when you're an Amiga or Atari entusiast. Other people also got this ablity, but I won't bother to write their names since this is starting to look like a demo greets list. I feel I have yet not got this ability, but I am comming along...at leat I hope so.......(I bet someone would have used this free space to write NOT so I did't keep it open).

Greetings from

Rune H. anti sig.file activist

BTW A1200 SUCKS ;) ;)

Do you mean that the human eye can distinguish betweem more than 16,7 million colors??

Then 24-bit color would not be enough to get photo quality pictures since you can distinguish between all the colors.

I belive you have got this thing a bit mixed up!!!!!!

Greets

>
>Neil, does this mean that the much vaunted STe-compatibility is all for
>naught? Your description of the bug made it seem like practically any
>game written well would do nasty things on the Falcon's screen...

Put simply, the bug is that the Falcon will implement a change of screen
address at any time the video hardware is not accessing the screen RAM.
ST's etc will only implement the change at vertical blank but before causing
the interrupt. So ST programs that do proper screen handling will on some
occasions end up writing to the visible screen when using double buffering.
This looks poor. Effects include rippling and slicing.
I have seen some programs that suffer from this already. Mind you few ST games
(<10%) actually work on the Falcon so maybe the video bug can be considered
the least of it's problems.

>Any idea of what revision of Falcon you've got?

Personally I have a pre-production machine with a revision 2 motherboard but
I have tested and observed the video bug on a production machine with a
revision 3 motherboard. Since I informed Atari UK of this bug last July there
has been plenty of time to fix it and indeed a new video chip has been
created since then. At the very least they should document it and then fix
it. The _VDO cookie could be used to identify the wayward chip. For the
time being I just handle the screen differently if _VDO >= 3.

Here's another suspect dealer, HCS (the so-called memory specialists) from London. I've been waiting since last April for a replacement Fast-RAM board and monitor for my TT. I must have made over a 100 telephone calls and numerous letters, but nothing will shift them. I've even visited the company (preorgainsed) only to be told that it was inconvenient! (Having travelled about 300 miles). In the UK once you accept repair of faulty goods, the dealer can sit on your order for months (even years). What I have learned is that for the UK, what ever you do, do not accept a repair for faulty goods, instead just ask for your money back. It seems one can do this only if you ask within 2 weeks of receiving your goods (I think this is right). Anybody know what the rules are if one has paid by ACCESS card?

Here is a Wall Street Journal article about Atari founder Nolan
Bushnell's latest business venture.

The Wall Street Journal
Monday, February 1, 1993

Atari Founder Seeks To Break New Ground With New Software
* * *
Startup Firm Is Set To Launch Product Linking Phones And Desktop Computers

By Ken Yamada
Staff reporter of the Wall Street Journal

Nolan Bushnell made a fortune when he invneted the first commercially
successful video game called "Pong", and later founded video-game maker
Atari Corp. (correction- Atari Inc. -MNJ) Now he hopes to break new
ground with software that will tie together desktop computers and
telephones.
Since Atari, Mr. Bushnell has started several ventures, succeeding
in some, flopping in others. He is currently chairman of a small company
called Octus Inc. The San Diego, Calif., concern plans to publicly unveil
its first major software product this week, and begin sales in the second
quarter.
The software is targeted at corporations with moderate to heavy
telephone usage and will be sold through manufacturers and vendors of
computers and telecommunications equipment, Mr. Bushnell said in an
interview. He wouldn't estimate how well the software will sell, but
described the market for such products that tie togeher computers and
telecommunications as new and growing to "billions" of dollars during the
next three years.
Mr. Bushnell said the company expects in the second quarter to
announce the names of some of their vendors and customers. The software
will allow co-workers who answer telephone calls for one another to
exchange messages about the call on computer screens, refer callers to
different recipients via computer, dump calls into a voice mail system,
fax data and perform other functions, he said. The Octus software will
cost $500 a copy loaded on a desktop computer, he said.
Last month, Octus had an initial public offering that raised about
$12 million, Mr. Bushnell said. In 1992, the company was closely held and
wasn't required to disclose earnings. A spokesman said the company had a
net loss on revenue of $5.1 million for 1992, primarily on sales of its
laser printer equipment, which it is phasing out.
Equipment required to run the software includes computers using
Microsoft Windows, a voice mail system and telephone equipment called

Centrix, which is offered by various telephone companies, Mr. Bushnell said.
Stewart Alsop, who is familiar with the product and is editor-in-chief of Infoworld, a computer trade publication, said the new software addresses a growing need by businesses to integrate different electronic devices in the office. "Suddenly you can start merging all of the systems at your company," he said. But companies lacking the specific computers and telephones needed to run the software may find installation cost high because of new equipment costs, he said.
Octus software faces other hurdles as well. Such companies as American Telephone & Telegraph Co., and other software and computer concerns are developing their own versions of similar products.
A spokesman for Pacific Telephone, a unit of Pacific Telesis, said the Octus software is "definitely something we're interested in," but said the company hadn't yet made a decision to offer it to its customers.

(By the way, Octus trades under the symbol OCTS. It is around $5 a share -- MNJ)

Obviously you aren't a musician. Or, if you are (and I can't tell where in the world you are from your email address) you're probably American where the Atari isn't doing so well (is that last statement true). Musicians can't wait for the Falcon. This can do direct to disk recording for gods sake, as well as running GEM, the various ports of the top of the range MIDI software shouldn't take long to do (if they're well written :-)).

> Alright, you're gonna have one or two games by Jeff Minter, but that's

2938. TT questions

Newsgroup: comp.sys.atari.st
Date: 1993-02-17 11:37:25 UTC
From: FARAMIR@EZINFO.VMSMAIL.ETHZ.CH
Message-ID: <1993Feb17.113725.28784@bernina.ethz.ch>
Source record: 209979

Hi all,

I'm an owner of a TT (that's one more for Switzerland, see 'How many TTs are there') and I have the following questions:

- Is there a program that permits to switch the resolution automatically when I start a program? I know there are some graphics cards supplied with a program like that, but I don't want to buy a card just because of the software.. DCRUNREZ is no help, because the switching should work with GEM programs, too.

- Does anyone have the game "Lure of the Temptress and knows if it runs on the TT?

Any help is appreciated.

Martin

> that for making 'cookie cut' bobs, the Amiga's blitter has to do
> one operation, whereas the Falcon's blitter has to do 3 operations
> (someone proved this a while ago).

I'd really like to see this 'proof'. I have programmed the ST blitter
to display sprites: it just requires TWO operations.
Here's my proof:
to display a sprite, you make: dest <- (dest ^ mask) v sprite
that means 2 op (how else could you do it with your 3ops Amiga
blitter in one operation?)
so on the Atari blitter you just make these 2 ops:
dest <- dest ^ mask
dest <- dest v sprite

> This actually makes the Falcon BLiTTER (TM) 3 times slower, if
> we assumbe that both run at the same speed in their performance.

From what I've said, you could think ST blitter is 2 times slower ('if
we assume...')...
That's wrong:
- dest <- (dest ^ mask) v sprite => requires 4 mem accesses
- dest <- dest ^ mask => 3 mem accesses
dest <- dest v sprite => 3 mem accesses
=> 6 mem accesses
So 1.5 time slower...

From what I've heard the Falcon blitter is the same as the ST one, but
it's 4 times faster (on the ST the blitter requires 4 cycles @ 8 Mhz to
read/write a 16bit word; what I'm sure of is that the Falcon blitter is
16 Mhz, and probably does an access in 2 cycles; could someone tell me
if this is right?).

Anyway I know for sure that the Amiga 500/600 is superior to the ST with
a blitter for graphics displaying.

I'm just wondering why Amiga owners are so aggressive. Psychiatrists say
aggressivity comes from frustration :-) (don't flame me, I'm just kidding)

Laurent

2940. DEcompress with COMPRESS.TTP

Newsgroup: comp.sys.atari.st
Date: 1993-02-17 11:52:56 UTC
From: mbdqbest@diamond.sara.nl
Message-ID: <1993Feb17.115257.2968@news.sara.nl>
Source record: 209977

COMPRESS.TTP works very well, but it has a pecularity.
To DEcompress a file,
1) use the -d option, and
2) make sure that the file extension is of the form .XXZ
where X may be any letter.
It does not work on files with any other extension.

Double-click COMPRESS.TTP, type
-d my_file.xxz
and you get MY_FILE.XX

From: aj882694@tasman.cc.utas.edu.au
Message-ID: <aj882694.729951259@tasman>
Source record: 209982

I have a Mega 1, upgraded to a Mega with an xtra RAM board. I installed it OK and once the Blitter was turned off, it came to life. IBM PC-DOS v3.30 formatted and installed the Hard drive OK (well the first 10 meg partition).

Here's the problem: It won't boot from Drive C. It will run/install programs on the hard-drive, c., just no auto boot. I have version 1.0 of PC DITTO II.

Any help would be appreciated. Also: I keep seeing ref's to v3.0. What was the last version of this program? If Avant Guard are no longer in business, is there anything to stop me upgrading to a later version? Would this help? Is there someone willing to do this?

Finally my Program disk had no diagnostic program? Again, is there anyone willing to provide that for me?

Thanks, Andre

>What I don't like are huge accessories of which I only need a small part.
>
>For me, a comfortable job control would the most important part of such
>a program.
>

I have to admit that I would prefer the CPX idea on a single-tasking OS but if this program is to be used solely with MultiTOS, then making it an accessory isn't such a good idea. It must then remain in memory all of the time, even if it is a CPX (then XControl has to remain in memory)

It would be a much better idea to keep it as a program - it can then be loaded when necessary and will not take up ANY resident memory, only allocating some when it is run and then freeing it when terminated.

Those people who want the program on hand ALL of the time in memory, can set it to load automatically in their GEM.CNF and it will remain on the DESK menu with all the other programs.

Oh well, that's my bit said and done. Hope you follow my suggestion....

Any comments, please mail them to me at grw@ukc.ac.uk (a friend posted this)

Cheers,

>I've always wondered what the alternative is. What doies the Amiga do when
>you select a different resolution from the desktop?
>

Depends on how you go about it. It's possible to open separate
Application-specific screens and/or "Public screens" with resolutions, color
depth & palette independent of the one used by Workbench. It seems to be
fairly tough concept for folks who haven't used it to grasp, but basically
you can have as many different screens as you've got the Chip RAM to hold,
and drag & shuffle them up & down as if they were windows. Although this
kind of eliminates the need to change the Workbench depth/resolution/colors,
it can still be done without a reboot provided there are no current WB-launched
programs running.

Most musicians will probably never hear about it, especially here in the
US.

>prices for f ex. a KWAI 16 bit sampler with 512K cards it's outrageous. The
>falcon can record DIRECT TO HARDDISK and thats a breakthrough for stribing
>musicians who can't afford to buy a expencive sampler and a lot of ram cards
>which cost a LOT of money.

If direct-to-disk sampling is the biggest breakthrough the Falcon can
come up with, then it's dead already. I can do that with my $30, 5 year old
Perfect Sound sampler and a PD program. Most of the current crop of $150
16-bit sound/MIDI/CD-RO controller combos for the PC can also, as can the
Amiga and Mac 12- and 16-bit high-end sound systems.

>Just wait and see after the big MIDI messe in Germany before you say
>anything else I'll bet the response will be enormous.

I wonder if Amigas will show up running the Sunrize 16-bit cards or
the One Stop Music Shop (you know, 32 voices of 16-bit sound with hundreds
of built-in high quality digitized instruments... can your Falcon do that?
Come to think of it, can you even _get_ a Falcon yet?)

Well, Atari will first need to make a new version of Xcontrol, for the one
supplied with TOS 3.06 doesn't work correctly with MTOS and 3d objects.
Most curious, though, is that the problem it has with mouse forms seems to be
there in TOS 3.06 as well (I don't believe it would be my graphics board that
causes the problem).

>production?) and what software the programs were tested under (with
>or without multi-TOS?)

The ratio IS that bad for running games software. It just isn't happening. MultiTOS will stop VIRTUALLY ALL games from running on the Falcon (they all violate memory protection). Even without MultiTOS, the games in general will not work. Speedball2, lemmings, Gods, Rainbow Islands, non of them work.

On the plus side, a fellow f030 owner in germany has just sent me a boot sector patch to fix it for some games (eg. Midwinter 2) so perhaps there is a light on the horizon.

>Atari asking them to "get off their butts." If the management think's it's a
>lost cause, maybe finding out how many people out here really want Atari and
>the Falcon to succeed will change their minds.

I believe there have been occasional letter-writing campaigns, but
to be honest, I couldn't tell you alot about them. However, Atari's
director of communications, Bob Broadie, does check out Forem-net and
GEnie, and cannot but notice those type of messages.

I would say that (IMHO) Atari is ready to get back into reality -
the Falcons are slated for U.S. release next month, and Atari has made
some good decisions lately (sending magazines like BYTE Falcons for
review; and particularly hiring Eric Smith, the creator of MiNT).

Having a system that's compatible with earlier software, plus what
is essentially at least a VGA-level 16mhz 030 multitasking machine with
multimedia capabilities, is at least on the right track...

Of course, if you want to send them a letter voicing your concerns,
then you should anyways. It lets them know there is more concern out there...

:

Recently I've been looking for a hard drive, and Gasteiner were people who I phoned. They were very unhelpful on the phone, so I missed them out. In the end I went to Ladbroke - they said that it would be a week before they got any controller cards in, and I was prepared to wait that little bit longer. A month later, and still they had no controllers, so I cancelled my order. Less than 24 hours later, my cheque was back (registered post) and no hassles. They had also been very helpful on the phone, actually knowing what they were talking about. Seems it's not always the comapanys fault.

Intersting to note though, Gasteiner have already sold approx. 2000 falcons which they do not yet have. If you look in the adverts in UK magazines, the falcon configurations which they advertise are not possible (0/8/16 meg)

: I need some help building a cable to connect a Nanao [Eizo in Europe]
: flexscan 6500 grey scale monitor to the TT030 for high res ECL 1280x960
: output. I do not know much about ECL monitors so I did not want to build
: the wrong cable an destroy the monitor, I have the pinout for the TT and
: the monitor. They are :

: ------------------------------------------------------------------------
: TT030: Pin Signal | Monitor: Pin Signal
: 1 Red | 1 ECL + (MSB)
: 2 Green | 2 ECL - (LSB)
: 3 Blue | 3 ECL + (LSB)
: 4 Mono ECL out + | 4 Open
: 5 Ground | 5 Hsync
: 6 Red Return | 6 ECL - (MSB)
: 7 Green Return | 7 Ground
: 8 Blue Return | 8 Ground
: 9 Mono Detect (input) | 9 Vsync
: 10 Ground |
: 11 Open |
: 12 Open |
: 13 Hsync |
: 14 Vsync |
: 15 Mono ECL out - |
: ------------------------------------------------------------------------

: It is clear that the cable should be at least

: TT End Nanao End
: ------ to ---------
:
: 5 7
: 10 8
: 13 5
: 14 9

: But I don't know where pins 4,9,15 on the TT port should go to on the Nanao
: port? Any help would be appreciated.

: Cheers,
: Scott Kolodzieski

You want to connect the grey scale monitor to work in TT high res mono mode correct?

Connect tt port pin 4 to monitor 1 and 3
connect tt port pin 15 to monitor 2 and 6
```

TT port pin 9 should be connected to ground to tell the computer to switch to mono.

The monitor you have got as it only has MSB and LSB inputs must be 4 shade greyscale

EXL is a logic standard where you transmit a logic signal AND the inverse of it (the + and - denote this). This method reduces the effect of interferance.

Gareth

You FORGET that the new color Mac Classic comes with 4 Megs of RAM.

The Falcon030 $799 version comes with 1 Meg. Let's add another $200 to
that price.

If the Falcon didn't come with a DSP, I'd say it was over priced.

>16-bit sound/MIDI/CD-RO controller combos for the PC can also, as can the
>Amiga and Mac 12- and 16-bit high-end sound systems.
>

I have not seen a $150 card for a PC (yet) that offers 16 bit stereo sound
capability, stereo inputs, and direct to disk recording. I also do not see
a lot of PC MIDI software to support this as part of the sequencing
capabilities.

I will have to say that a $30 Perfect Sound will not compare to a
professional sampler. The hype over the Falcon is that the internal sound
hardware is comparable to a professional keyboard costing about twice
as much as the system.

You seem to want to bash the Falcon simply because it's an Atari. I do not
think it is going to be an unqualified success, but I do feel it is going
to cause a major change in the MIDI niche markets, and possibly lead to some
major changes, especially in the area of digital recording.

You are right and I apologize... yesterday I made some BLiTTER calcs
myself and this is true. Shall be 2 times slower. The Amiga does it
this way:

dest <- dest ^ mask v sprite

|>
|> > This actually makes the Falcon BLiTTER (TM) 3 times slower, if
|> > we assumbe that both run at the same speed in their performance.
|>
|> From what I've said, you could think ST blitter is 2 times slower ('if

|> - dest <- dest ^ mask => 3 mem accesses
|> dest <- dest v sprite => 3 mem accesses
|> => 6 mem accesses
|> So 1.5 time slower...

IF both take the same time, yes. However, rumours here have pointed
out that the Amiga blitter is faster by itself, but then, whe shall
get real proof.

|>
|> From what I've heard the Falcon blitter is the same as the ST one, but

|> if this is right?).

Good question. I know the Amiga's A1200 blitter is faster too, supposedly
4x too. My question would be more, which blitter is actually faster.

|>
|> Anyway I know for sure that the Amiga 500/600 is superior to the ST with

>card?
>

If you are not satisfied with the service provided by the company whom you've already paid through Access or if the company is delaying the refunding of money taken from your Access acount once the faulty is good has been returned you can always complain to Access. Access in turn is committed to take actions. Alternatively, you can also visit your local CAB (Citizen's Advice Bureau) and ask for advice. Some magazines also take actions against companies who regularly advertise in their magazines if a serious complaint is made. I had problems with Gasteiner and also with Third Coast Technologies. In both cases I wrote to Access & also took the advice from my Univ. student union advisers. Only after these the matters were resolved to my liking.

I've had many transactions with Power Computing and always found them prompt & provider of good service.

Neuromancer -- (geez, love that nickname), the new little Mac Color Classic with it's iddy-biddy 10" color screen, 16MHz 030, etc, is to retail for $1389 and that includes 4Mb RAM and an 80Mb hard drive. So, compared to the Falcon comparably equipped, the two units are at a price parity.

Please note I am NOT recommending the Color Classic over the Falcon, just clarifying the cost differential between the two machines, OK? OK.

> I can also recommend Pure C, which is about the same price as Lattice C.
I didn't recommend Pure C, because Pure C is not a full ANSI-compiler even
though the distributor tells you, that it would be one. Also Pure has (opposite
to Lattice) by far not that many tools (Lattice has: X-referencer [built into
compiler], CPX-builder, RCS, dis-assembler,... - Pure has none of these).

Also - Lattice has far better libraries and documentation.

>> Lattice includes an Resource Kit (WERCS) or you can get a very good

Hmm, I mainly told that Lattice includes WERCS. I normally use ORCS (which is a
bit like Interface / Kuma-RCS).

Hmm, Lattice doesn't have 030-specific libs. Your "bug-sightings" might have other causes. Due to some comments a while ago in AtariNet, that there were some problems when MiNT uses the 030s MMU for memory protection, a problem that wouldn't occur in the 68000 versions, that don't support any MMU.

bye,

Benedikt

>
>Neuromancer -- (geez, love that nickname), the new little Mac Color Classic
>with it's iddy-biddy 10" color screen, 16MHz 030, etc, is to retail for $1389
>and that includes 4Mb RAM and an 80Mb hard drive. So, compared to the Falcon
>comparably equipped, the two units are at a price parity.
>
>Please note I am NOT recommending the Color Classic over the Falcon, just
>clarifying the cost differential between the two machines, OK? OK.
>
>---

Okay, if you want price break downs, I'll give you some:
Item List Price Street Price
Falcon030 $799 $699
4meg RAM Upgrade $200 $160
14" VGA Monitor $299 $229
85mb IDE HD $299 $229
---- ----
$1597 $1317

The street prices are what I've seen advertised. The HD is a Maxtor 2.5".
So, you see, for ~$72 less, you get a 50%+ bigger screen, and a MUCH better
machine. Not to mention the fact that we assume everybody needs that much
RAM, or an HD, or won't just hook up their machine to a TV. That's the great
thing about this machine, you have a choice. Start from the bottom, and work
your way up.

[If anybody has found better prices, e-mail me with info, please.]

2965. network connection advice needed

Newsgroup: comp.sys.atari.st
Date: 1993-02-17 16:53:48 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <17FEB93.11534864@cc4.crl.aecl.ca>
Source record: 209905

Network Connection Advice needed

I would like to connect my TT to the VAX network in my workplace. Right now, I have a connection via a Northern Telecom SL/1 digital modem (19,200 baud) but I would prefer to switch to EtherNet.

I obtained information from X Software, to run XWindows - TCP/IP via an VME based EtherNet card. This would cost be about 2100 DM (about $1500 CDN I think).

Our site purchases EtherNet cards in quantity for PCs and the cost is less than 1/2 the X Software price.

Question: Macs can be connected to the EtherNet highway via an Appletalk/EtherNet bridge. Can I use the TT's LocalTalk port and bridge the same way (I guess the answer to that depends on the appropriate drivers)?

If anyone has advice on the TT's LocalTalk, or even Gadget's MegaTalk, I would like to hear from you.

I would really hate to be forced to give up my TT and go to a PC just for the EtherNet (I could not tolerate the loss in productivity). I may have the option of going to a Mac but I found that the Macs have really crappy telecomm packages (I've used VersaTerm and Mac240). If I just used the netlink to access drives and share files I would not have to run the telecomm packages because Pathworks attaches net devices as logicals without logging on via a telecomm package.

Once last bit of info; I have a Spectre GCR. If I get an EtherNet card for my TT, can I establish the EtherNet/Pathworks link under GCR's Mac emulation?

Well, given your expletive above, I would say the talking is much better
than this response.

>OverScan, Berlin-Germany has made ScreenBlaster: A hardware expansion for
>the falcon, and it ONLY uses the internal graphic-hardware.
>Standard 640x480x8bit 61Hz -> 80Hz, or to 880x608x8bit 61Hz !!!!!!!

Except its not standard. The expansion obviously doesn't use only the
internal graphics hardware of the Falcon, otherwise no expansion would be
necessary. Michael's point is quite valid for the standard machine layout,
as he was not talking about the expanded system.

Though I don't personnaly think that self extracting files are good for
Usenet (people using ftp are certainly able to use an archiver), note that
Info-Zip's unzip is able to extract stzip self extracting files if they do not contains
comments (this problem with comments will be removed in a
future version).

e> Did someone had this problem also ? I guess time outs are faulty on 030
e>hardware.
It seems that MSTEs cause trouble when using TOS2.05, but not when 2.05,
and there seems to be a difference between the public and the registered
version. Sometimes the troubles go away when the MSTEs use the registered
version - maybe this can help with TTs, too ? any experiences ?

YR>But does anyone know if this system is also available on disk ?

You can relocate and load TOS 2.06 using a special loader program - this
works fine for testing patches etc., you can even get it reset-resident.
However, if you want to use a copy of 2.06 without owning the original
(EP)ROMs, this is a pirate copy of the TOS which Atari does not like at
all !

: Greets

: Rune H.
Hey, I'm not saying that people who know about the Falcon won't buy it.
If it's really that good, I'm sure many people will buy it. But the big
market, unfortunately is PC's and Mac's. Back home, I know about 30 people
who own MIDI products. A few of them use them professionally. 20 of these
people own PC's, 7 own Mac's, and the other 3 own amigas (just because my
friends, who had amigas, decided to go into MIDI) Very few of these people
know about the existence of the falcon. Even less believe the claims about

how great Atari MIDI stuff is, or they don't care because they want to use their PC for other non-atari stuff. Maybe this isn't indicative of professional musicians, but on the whole it's a much broader audience. I'm not saying all people will overlook the Falcon. I'm just saying that most will, for the same reason that the Amiga gets overlooked.

>They are still very expensive! ^R&#65533;
>A mac' at roughly the same spec's as the Falcon, costs twice as much!

Maybe you should check the prices of an LC II or an LC III (25mhz 030
on a 32-bit bus, $1379 *LIST* in 4/80 config). It even has sound input
(although only 22Mhz mono-8bit sound, but then, alot more software uses this).
I would hardly call this "twice the price of a Falcon" when a Falcon 4/65
is going to list at about the same price!

>as mac-classics is improving, but they don't stand up to the technology
>in the Falcon. Also, it doesn't change the fact, that considering
>what's inside Mac's, they are WAY overpriced! (Great machines though....)

You need to compare the Falcon to a Classic II, LC II (the machine that
is closest in processor speed) and I don't know the new list price for it.
I think it's ~$1000 in a 4/80 configuration. And there's always the LC III.

I think you need to catch up on the current status of the Mac world.

> archiver-market is a real swamp!

It is incomprehensible to me why any human would have created ANOTHER
bloody archiver that

a) has a name conflict with an existing archiver but is not totally
compatible with it
b) uses a stupid choice of extension (.z) which was used recently for
something totally unrelated
c) cannot do multiple files/directories like a real archiver
d) was completely unnecessary since the portable zoo archiver is more
powerful, exists already, has good features for corruption recovery,
and handles multiple files/directories.

The compress/tar garbage is so outdated now, Unix should let this die.
So what does someone do? Invent yet another archiver based on this outdated
technology. Groan.

SpeedoGDOS and AtariWorks should work with the Megas and STs. There's nothing
system-specific in there that should prevent it from working.

Well I seem to recall that it's not free of charge. I sent in for my updates to NeoDesk and NeoCLI. You are not required to send you original disk in for the NeoDesk update (it's just a patch) but are for NeoCLI. I think the update was $5US (or real close to that). If you're not in a hurry I suspect that eventually the patch program will show up on GEnie or A.A. By the way I haven't receive my updates yet (it's been just over 2 weeks).

2980. Falcons in US! - Atari dealer and his impressions

Newsgroup: comp.sys.atari.st
Date: 1993-02-17 23:10:02 UTC
From: dud@stein.u.washington.edu
Message-ID: <1lugkaINNe65@shelley.u.washington.edu>
Source record: 209920

You may recall about a week ago I posted my thoughts about the Falcon that landed at our local dealer, Xanth Corp. On the store's BBS (Xanth's; 206-868-8903), Dan (I believe he's part owner...) posted this message:

Conf : ST_HW_SW
Msg# : 68/68 Lines: Extended Read: 6
Sent : Feb 16, 1993 at 9:22 PM
To : All
From : Dan
Subj : Falcon 030

A couple of notes about the Falcon and a little crow eating. First off, there are two but they are identical and we saw no reason to have them both set up. As it is, the other is destined for other parts but we will keep the first. Secondly, the machine was not permanently hooked up to the monitor that was there (I believe it was a JVC SC1224), that monitor just happened to be handy. Thirdly, my speakers we only working on one channel through the Falcon and I hadn't repaired them.

When Dan was there we tried using the SC1224 in all resolutions but the JVC failed to handle it. Today we hooked up a Goldstar SC1224 and it worked famously, though the desktop flickered like an Amiga. Makes sense, the 1224 wasn't designed to display that resolution (640 X 480). When Slidshow ran (RGB) version it supported overscan. This is a giant leap forward for Atari display paremeters.

The more I use the Falcon, the more I am impressed by it. I am still getting used to it and am an absolute amateur with Multi-TOS (MiNT). Speaking of MiNT, it is memory hungry. With the 4 meg version there isn't much room (around 2 meg after MiNT installation) to run anything. This isn't a heck of a lot of room to stretch about in. The "nicest" program outside of the stuff we got for it in regards to emory usage has been Sillouette. Nice program by the way. It will leave about 1 meg free after running (I assume this would change when large files are openned.) ONe thing, Sillouette must run in ST High resolution.

Like a lot of programs that have run on the Falcon (Not necessarily MiNT) they run in a "compatible" resolution. One exception was Castles. This would execute in any Falcon resolution and transfer to low res. Dooesn't exit so cleanly though.

I'm looking for more pictures that run on the Falcon slideshow. They have a TGA extender and the theroy is that they are Targa Image Format files but they have been modified in some strange manner (The Targa is the leading Video capture board in the PC world and you could expect to pay around $2000.00 US for a good setup.) The files in the slide show are ALL

the same file size. That is not possible unless they have been fiddled with. They will load into Photo Styler on the PC but with some distortion. (Actually they load into Photo Styler with the true aspect ratio according to the file but some of them appear distorted on thge PC while others looked squashed on the Falcon.)

Back to displays. The machine os now set up with a TT monitor that we have temporarily. This will not last long I think though the display is comparable to a Multi-sync monitor (It bloody well should!). We also have a Viewsonic 6E in the store for a short time. This has so far been the best display device for the machine that we've seen.

Inside the Falcon-first, there isn't a heck of a lot of room. The 4 meg memory card is about 2 X 4 1/2 inches and about half an inch high. It sits bridged across the O.S. which now resides in a socketed flat-pack (square) chip. Kind of like a small MMU. The drive is a 65 meg Seagate 2 1/2 inch IDE drive about the size of a pack of cigarettes but half as thick. Nice drive. Chips are surface mounted and the board itself appears to be a multi-layer board. What this means is that service will be a board swap procedure. It will be amusing to see how that is handled. The board is surprisingly clean for a one-off production run like this. It is very likely the production dyes and so forth existed, they just needed to find a home. (Wanted: One (1) Falcon 030 production facility.)

Back to the memory, they are using 4 meg DRAM chips on this card and it will be amusing to see the 16 meg board. I assure you that will be a tight fit.

The Falcon does sport a fan, positioned just next to the mouse ports (Still in their much-loved spot) and as close to the RAM as possible. It is very quiet and the Seagate makes a bigger if still quiet noise.

In closing (for now) Paul Varn mentioned that there was a write-up about the Falcon in BYTE magazine. I haven't seen it but it is refreshing to see an Atari product get national press attention. Let's only hope that the powers that be have the forsight not to screw it up.

-Daniel

>Spectre GCR does not.

In a fit of desperation, I plugged my STereo-Replay cartridge into the Falcon, and ran the Replay sound editor. It worked fine, for both sampling and playback. (Now you may wonder, *why* in the world would I plug in a silly 8-bit stereo sampler into a Falcon when it's already got 16 bit stereo audio jacks on it? Mainly because I have no other software handy that has a finished interface for recording and manipulating samples, and you can do a lot more work in 14 meg of RAM than in 4....)

The Falcon was voted "Best of Show" at NAMM a month ago. Just about all of the
professional musicians in the country keep track of these sorts of events. In
short, *lots* of musicians already know about it...

>>prices for f ex. a KWAI 16 bit sampler with 512K cards it's outrageous. The

Hm, I have a hard time believing that a 5 year old card for a PC can even
generate the 200KB/sec data stream, let alone write it to disk... Maybe
if you turn off the video? Geeze. On an AT-bus or better it's certainly
more plausible.

>Come to think of it, can you even _get_ a Falcon yet?)

Nope, must admit, there aren't any built-in instruments. Rather a silly question to ask about a general purpose computer, eh? Lessee, 32 voices, at what sampling rate? The Falcon's 8-channel limitation is really only a feature of the operating system; you could easily write routines to set up the DMA operations yourself, and increase the number of voices to any arbitrary number, although you would eventually begin sacrificing quality (i.e., sample rates would have to decrease). As the most obvious change, you can take the 8 channels at 50 khz and instead use them as 16 channels at 25 khz, still better quality than the 22 khz commonly used on Macs. If you write your own DMA routines instead of using the handshaking routines built into the OS, you can eliminate some overhead and get 11 channels at 44.1 khz, 10 channels at 50 khz, or 20 channels at 25 khz.

> Except its not standard. The expansion obviously doesn't use only the
>internal graphics hardware of the Falcon, otherwise no expansion would be
>necessary. Michael's point is quite valid for the standard machine layout,
>as he was not talking about the expanded system.

The expansion is merely a new pixel clock, fed into the external clock input on the Falcon video port, no video hardware is changed. The simple fact is that the the Falcon video hardware *will* operate at those resolutions, given a faster dot clock, and the video bus *will* be able to keep up, with nothing else changed. The "expansion" doesn't change the bandwidth of the Falcon bus, because it doesn't need to...

Got a question:

Is the 7MB/s CPU to Chip Bus bandwidth also true for the A4000 or just
the A1200. What happens in the A4000, where you have a faster cpu like
the 68040.... is it the same?

Thanks

|>

|> display.

You can still do what the other guy claims the Falcon can do,
one blitter call for the 8 bitplanes if they are properly ordered
in memory, with a copperlist that supports that order.

2990. FTP Mystery!

Newsgroup: comp.sys.atari.st
Date: 1993-02-18 03:29:21 UTC
From: foroughi@cs.arizona.edu
Message-ID: <32622@optima.cs.arizona.edu>
Source record: 209930

As a new Net user I was delighted to find out about "ftp" and the various ftp sites. I thought now I can get all those hard-to-find public domain programs for my Atari ST. However, my joy slowly turned into dispare when after spending hours at the keyboard I couldn't get a single downloaded program to run properly on my ST.

I have followed the step-by-step procedure outlined in guide.to.ftp. Yes, I did set the mode for binary file transfer before downloading the programs. I downloaded "zoo.ttp", "arc.ttp" and various ".zoo" and ".arc" files(I do have a copy of some of these programs; so I know if they are decompressed correctly they should run on my ST). Finally, using kermit on Uniterm I downloaded all these files onto my ST disk.

Now, up to this point everything has worked fine; ftp and kermit both have done the file transfers without any errors. Now comes the frustrating part; "zoo.ttp" and "arc.ttp" can not dearc a single .zoo or .arc file. I have also tried the following without any luck:

1. Using my own "arc.ttp", which I KNOW works, to dearc the .arc files.

2. Decompressing the .zoo files in my local UNIX environment using the latest version of zoo and then using kermit to copy the straight binary files on my ST disk.

I wasted at least six hours! Do a good dead today, help a fellow Atarian. Thank you in advance.

You never mentioned the file transfer mode that kermit is in. I found out the hard way when I used to use kermit that it needed to be in binary mode as well. I may be wrong, but I think kermit's text modes are designed to translate text files from ASCII to EBCDIC and vice versa if necessary. So you'll need to change the settings on both the host's end as well as your end. If possible, I reccomend using X, Y, or especially Z modem. Even X modem has superior file transfer times in my personal experience. I hope this helps.

> advantage of any special hardware you may get (Crazy Dots board, etc).

Don't bother with GEM-View to View GIF's with on an ST. (TT or
Falcon, fine....) As it only shows 16-colors. And the latest version
only *just* works in 1meg. (Mine crashes when I hit 'Load file',
that's with NO TSRs, or DA's, 1meg, TOS 1.2)

Photochrome will do the trick nicely, allows viewing of GIFS in the
full 256 colors on any Atari Machine. (And will let you do all
sorts of fancy trickery to view them in 4096 colors on an ST (flickery)
or on an STE (great), or 19200 on an STE (flickery).
This greatly improves the picture quality, as it smooths out all the
lines etc. Marvellous!

If you only have an STFM, you can still view the pictures in the flicker-less
512 color mode/s! If you want a clear pic'!

Well, I'm definitely hanging on to my TT for a while yet (wan't to get my money's worth out of it). Any upgrade is a couple of years off.

The Crazy Dots board sounds like a good idea, if a little expensive (~$CAN1000!). My local dealer figures the price will come down after the Falcon is released and more resolution-independant, 8-bit colour software is released (but then again, I AM a working stiff now...hmm...).

> my ST disk.

The most likely problem that's left is that perhaps you need to
explicitly set parity/number of bits. You may be trying to transfer 8
bits over a 7 bit line, and just throwing away the extra bit.

a) Until you are sure you have things working, find a SMALL .zoo file,
and do the testing on it. It doesn't make sense to transfer a LOT of
garbage around while testing the connection.

b) Try invoking kermit at the UNIX end using the command:

kermit -p e -i

-p e is used to indicate even parity, 7 bits.
-i is used to indicate a binary file (which means you don't have
to type in the appropriate commands while in Kermit)

You might want to check the RS-232 port settings.
Hit "Help", to get to the menu screen, then hit "V" to head to the
RS-232 settings. If it is set to 7 bits, even parity (common) then

you need the "-p e" parameter when running Kermit under UNIX.
Otherwise, you could use "-p n" to explicitly imply :-) the use of 8
bits No parity.

Good luck!

I will be buying a Falcon very soon (hooray!), but what I want to know is: When will they be officially UK released? None of the shops I've been to even know its coming out yet!! Also, how much can I expect to pay? STF said that the standard Falcon would be 400 pounds, but all adverts I've seen are selling it for 500 pounds...Is this because they're imports?

Someone wrote to this group saying that alot of ST owners won't be spending money on a Falcon, since they'll be losing the ST games...well, I'm getting a Falcon, and I have over 100 ORIGINAL games..I'm just glad Stunt Car Racer and Dungeon Master work!

Anyone know whether or not Oids, Microprose Grand Prix, Microprose Golf and Dogs Of War work?

Martin

PS I will be writing games for the Falcon :)

> Or, if you are (and I can't tell where in the world you are from your
> email address) you're probably American

I'm from Scandinavia, specifically Sweden.

> Musicians can't wait for the Falcon.

OK, I better explain myself. I do not doubt at all that the Falcon
is perfect for musicians. But since the PCs and Macs are so widely
spread over the world, a lot of extremely good music software has
been - and continually gets - developed.

Why do you think people buy a PC, Windows, Multimedia kit, Sound
Blaster, etc. Without even _looking_ at the Amiga's capabilities?

I think that's stupid, just as you're gonna think it's stupid when
people continues to use PCs and Macs when the Falcon is here. ;-)

An important note; I'm obviously not saying ALL musicians or people.
I'm just saying many.

I'm afraid I've got some bad news for all those who hoped that by not compiling in certain features of the game the size of the binary would be sufficiently reduced so as to make it run on a 1 MB machine.

We found that by leaving out what was thought to be the most code-consuming option - MULDGN (Multi-branch dungeons) - the resulting binary comes out only 10 K shorter than before. This means there are still about 90 K to be saved.

No, I didn't want price break downs, but thanks for the obvious, anyway. :)

>The street prices are what I've seen advertised. The HD is a Maxtor 2.5".
>So, you see, for ~$72 less, you get a 50%+ bigger screen, and a MUCH better
>machine.

I too think the Falcon has the potential to be a much better machine than the
new Mac Color Classic. But _again_, I was NOT touting the Mac over the Falcon.
Both will be fine machines, in their own right, and the Falcon certainly has an
advantage with it's DSP chip. BUT let's try to be a little less biased, OK?
It's hardly fair to compare Falcon _street_ prices with Apple _retail_ prices
nor should you compare components bought from 3rd parties to be user installed
with Apple factory installed components (like hard drives).

The Mac Color Classic at $1389 RETAIL compares favorably in price with the
Falcon's retail price. We never really had to worry about competition from
Apple before because of their high prices. That situation has changed and
the combination of lower prices, "slick-Willy" advertising and a huge retail
network will surely sway some would-be Falcon purchasers. That was the ONLY
point I was trying to make about these two new 16MHz 68030 machines. These
are the facts; now let the buyers decide.

Source record: 209806

Well, with this flurry of arguments and shouting matches littering the net I am really hesitant to write this just because it might start another long, boring, argumentitive thread. However, I figure I might as well post it because people seem to be missing a critical point.

Step up to soap box

Amiga and Atari owners have been arguing for a VERY long time. Each time comparing their computers. Knocking down each other's faults, etc. In the earlier days of these computers I could see how this might be possilbe. In those days, things were brighter and sunnier for computer companies who were all trying to build general purpose computers. People were optimistic about their systems and what they could do.

Today however, Amiga and Atari only share a very small portion of the market (something like 5% but don't quote me). So when CBM and ATARI decided to build their newer computers they looked at thier cut of the 5%. When they did it seems that CBM found that the AMIGA was being used mostly for video editing and other video oriented things. Even professionals used it for video. When ATARI looked they found that musicians and sound people were using their computers. Even professionals used it for sound.

So each company went their separate ways and created a specialty computer. CBM's new Amiga was created to have enhanced video that facilitated editing, etc. Yet they also improved sound so that the users that wanted to do other things with their computer could do so. When ATARI created the Falcon they enhanced everything that could be used with sound. MIDI, direct to disk recording, etc. Yet they put improved video in their computer so that users who wanted to do other things with their computers could do so.

My point here is that because CBM and ATARI only have a small percentage of the market they could only afford to make specialty machines. So to compare each machine on their weakER points (AMIGA: sound, ATARI: video) is just plain silly. Not to say their weakER points are completely useless but this is just not what the machines were designed for.

(Warning pompous statement to follow)
So now that you understand. Could we all get back to some serious and thought provoking discussions rather than the trash that's been floating around and wasting bandwidth for the last week?

Step down from soapbox

Thanks.

3019. Nethack 3.1 color problems

Newsgroup: comp.sys.atari.st
Date: 1993-02-18 17:59:30 UTC
From: paetau@mits.mdata.fi
Message-ID: <1993Feb18.175930.25688@prime.mdata.fi>
Source record: 209807

Is anybody else with a color monitor experiencing the same problems as I am, ie. Nethack will invert my screen when it has loaded. This annoys me, because it is impossible to have a black background and black borders. The closest I came by fiddling with the control panel colors was black background, white borders, and white background for rooms. I have a 4 MB STe with TOS 1.6 if it matters, and I use hackfont, and I have the color option set.

So, if there is somebody who knows how to avoid this I would apperciate to be told how to do it.

Thanks in advance!

>>
>GEE !!!!! talking about speed?? you are only displaying a picture !!!
>Wait until you get some games or something, then you will see ....

Well, since all games will probably be ports from the PC they will run in 320x200x8 in which mode both the CPU and custom chips have full access to chip ram and the CPU has full access to FAST ram all the time.

In this mode a game like Wing Commander (I or II) would be easy to do. No need for a bucket of CPU power.

Anyrate, the custom chips provide good performance and are ideal for a mutitasking system like the Amiga. And you are right, it would be intresting to see how fast the AGA chips could drive a 640x480x8 non interlaced display. On the other hand you can drop that display to an interlaced mode and reduce your bandwidth by 50% thus giving the CPU full access to chip and fast ram. When chip bus saturation falls to 50% or lower the CPU has full access to it. You could do a hi res interlaced game in 256 colors at a very reasonable speed. The folks who use TVs for monitors would appreciate this.

Ian.

If any of the stuff I posted up there is wrong, let me know.

In article <runehy.66.729936257@dhhalden.no>, RUNE HYLDMO (runehy@dhhalden.no) wrote:
: The problem with the AGA-chipset is that the A1200 must accsess the chip-
: ram on every VBL so altough the pure prosessing is faster with fast-ram
: you will probably not see it on the screen since the VBL's can't
: be updated in the same speedratio as the calculations. What I'

This is entirely incorrect. At 100% contention, the chip ram can only be
accessed during VBL.

This is _NOT_ all of the time.

This is not true, as an example, in 320x200x8, where there is 0%. This
_IS_ true, in 640x400x8 non-interlace. This is not true in 640x400x8
interlaced.

It's not as cut and dry as you'd like to think, especially with the sheer
NUMBER of resolutions and depths involved.

: m trying to say is that even though the A1200 is quite
: fast with fast-ram (NOT faster than F030) it's has little practical use in

Very likely faster.

The 020 in fast ram may not have burst, but neither does an 030. It also
has full 32-bit access to ram, while the 030 does not. That can lead
anywhere between a 110-200% increase in performance.

: games and programs that need fast screen-updates. I may have written a bit

Which would probably make use of 320x200x8, which has 0% contention, no
CPU cycles are being stolen from the CPU.

: of Norwegian-English here, bit I hope you get what I mean. The bandwith-
: tests stated in this tread clearly shows my point in 640x480x8bit color,
: non-interlazed, the bandwith is 100% saturated. Since the CPU needs 50% of
: the bandwith you can figure out for yourself that the prosessor is slowed
: down considerably and this mode is a bit slow to use in games which needs a
: lot of prosessing-power. BUT there may after a while be programmers that

640x480 (31khz Productivity non-interlaced mode) x8 does yield a 100%
saturation, giving you access on VBlanks.

: find a way to speed up this mode with various tricks as there have been on
: the Amiga and ST(e) models in the past. Again only time will tell. Great
: games like Civilazation and other games like that with few things happening
: at the screen at once you will see no slow-down in this mode I think.

Who knows. VBlank is actually a rather sizeable amount of time for fast processors.

: The A1200 is quite a good machine it has some features that the Falcon
: misses, but it's maybe more the other way around. If the Amiga had got a
: SCSI II port it would have boosted it's DTV greatly and not to mention the
: 16-bit sound an a standard! DSP. The A1200 would have been a low-cost
: alternative for semi-professional studios, but now it doesn't mesure quite
: up since the BIG, Mac price cuts.

Except the A1200 is more geared to be the new low-end machine. It's much cheaper to build than a Falcon, and the price can go a lot lower before C= sees a poor profit.

: The Falcon could have come with a real 32 bit bus, but I firmly belive that
: the dubbelspeed multiplexer will make up for that. It should also had a 32

It can't, as far as I can see. If, architecturally, someone could prove me wrong, I'd be happy. However, in order for the processor to NOT feel the bite, the memory would have to be so fast that it could service the graphics system, and then service a full-speed 030, invisibly.

People have enough problems squeezing a 3 cycle read.

: bits expansion bus, but this they have gotten around with a hack of some
: sort, ATonce has under development a 486 card so.. The gaphics could have

The Falcon seems to be a 68000-system with a 68030 tossed into it. The expansion bus, the memory architecture, everything seems to be geared not towards a 32-bit system, but towards a 16-bit architecture.

> No, a tiny minority of Amiga owners use their systems for video work.

The facts are that a good number of Amiga systems are purchased to do nothing but video related work. If you deny this fact then you need to crawl out of that little world of yours and open your eyes. And it is also a fact that a resolution of 1280x400 with overscan (forgetting the fact that it goes up to ~262,000 colors) is a wonderful resolution for video graphics - especially character generation. Real people with real families pay real bills doing this kind of work with their Amigas. I'm sure they appreciate these new modes, as do I.

>>Just like a lot of
>>Mac owners own Macs just to use as fancy typewriters.

> Yes, and just as the majority of Amiga owners use their systems as fancy
>Nintendos.

Well, using classic -MB- logic, I would have to conclude that a tiny minority of Amiga users use their computer only for games - since all the Amiga owners I know rarely play games at all.

|>either!!)
|>
<more stuff deleted>

It is a matter of personal taste, but I have used System 7 on a Mac SE and
I found it to be unbearably slow (system 6 wasn't much better for that
matter). I use a IIci at work and that even seems a little sluggish
compared to my Mega at home (with ADSpeed 16 & TurboST).

For that matter, all these spec comparisons don't really mean a thing.
If a machine will allow you to accomplish what you want it to do, 'feels'
good to operate, and is within your budget (or perhaps you're just willing
to pay the cost even if it is outside your budget), then that is the best
machine for you. I happen to 'feel' the best when I am operating my
Atari and I think a lot of people would agree (as well a lot will disagree).
Atari's biggest problem with respect to the Falcon is going be getting
enough people to 'feel' what it is like in order to decide it 'feels' good
for them.

With feeling...

3028. terminal program too smart...

Newsgroup: comp.sys.atari.st
Date: 1993-02-18 23:17:54 UTC
From: hjb@levi.th.vu.nl
Message-ID: <1993Feb18.231754.24566@cca.vu.nl>
Source record: 209818

I know this is going to sound silly, but does anyone
know of a way to trick Uniterm into NOT converting the
high ASCII characters to standard VTxxx characters but
to show the original Atari high ASCII characters, i.e.
Hebrew letters?

The reason: At work, we have a windows program (OpenWindows)
with home-made screen fonts that have the Hebrew character
set in the high ASCII range, with the same mapping as the
Atari. We use these screen fonts for programs that analyze
Hebrew bible texts.

It would be nice to run those programs through my modem as
well, especially since the mapping fits so nicely. But
Uniterm insists on emulating a VTxxx truthfully, so the
Hebrew letters come out as garbage.

It is not the modem that does that: a file with 'hebrew'
characters will show up right when transferred and listed
outside Uniterm.

Can Uniterm be made 'cheaper'? Or does anybody know of a
terminal program that keeps the hebrew? (probably visible
when you try to list a binary file on the remote host).

Thanks,
Hendrik Jan Bosman

Verify is a nuisance! I have NEVER had any defect disks, apart from the
ones my disk-drive stuffed up (due to a misaligned head, which I fixed)

I also always have write-verify turned off al the time, makes floppies
almost usable! Again, no problems in 8-years!

The macs I use at work (cx and ci) sometimes fall into a sluggish period.
I haven't figured out why yet. I start up NCSA Telnet and notice that
it scrolls *slow*. I switch to B+W and *boom* it's fast. But, other
times it's just as fast in 8-bit color. I haven't figured out what the
deal is (a lot of other people use the same computer(s) and I am sure one
of them monkeys the system into a strange config. They toss more DA's and
inits on. It's a pain to find out exactly what is causing the problem.
And, I don't really care if I telnet in BW, so I haven't bothered to find
out what it really is.)
But, in BW I haven't ever seen that happen. On an SE (I use both Sys 7
and Sys 6 on SE's reguallarly. I really don't notice the difference, but
in Sys 7 I think you really need 4 Megs to make it work well, but it still
works in 2 megs.

>Atari's biggest problem with respect to the Falcon is going be getting

>for them.

I agree. This is the thing that is really keeping me from getting a
Falcon. I don't really know what it will be like. I don't like to spend
that kind of money w/o getting a sample. (And it doen't help that I
can get a sample of the Macs.)

As I can remember UniTerm has no cheap mode in this respect.
You coul try to use CoNnect where you can set either ISO or
ATARI fonts and neglect the additional 8Bit vt commands when
in vt100 mode (which is even more correct than UniTerms behaviour)

Your right Atari was never in competition with the Mac because Atari had hardly any product on the market and Apple did not know it existed because of its insignificant.

Are you saying that the Atari St was never in competition with the Mac because of its higher price. The reason because of the high price of the Mac, because Apple had confidence that their product was worth more. They plowed the profits in R&D, marketing(Advertising!!!!) and taking care of their developers and customers...Are all ST owners Cheap?????????? The reason that Atari is in this mess today, because they competed on the cheap according to the Nintendo lawyer. Atari can't even upgrade its hardware because they charge soo little. The St technology today is were it was at in 1985...Thats pathetic...It just tells you the imcompetence of the Atari owners...You know who you are!!!!!

Over the Years, the St was cheaper than the Mac Equivelants, but Apple sold far more Macs than the St. Why was that? If you say it was superior marketing than you are right. Atari should of charged more to fund their marketing efforts and if they did, then there would be a higher install base of ST's. Who knows, than Atari would have the R&D funding to improve their line...

The ST was revolutionary back in 1985, but it is not today.....

I hope the Falcon suceeds, but I doubt it.

By the way can you upgrade the Falcons processor to a faster 030 chip or do you have to buy a future faster machine...

At least the Mac Color Classic user can upgrade to a faster 040 color classic by the summer time, by sliding out the very small motherboard and replacing it with the new one...Another Apple technological Advance with the user in mind...Thats what you get for spending 600 million dollars in R&D last year...

The average human eye cannot tell the difference between ranges of
colors after about the first 7-million. (Women have a higher range
of color recognition in their eyes, so they can distinguish more)

Myself, I can barely tell the difference after the first 10000 colors
or so, (stick 7777 beside 7776, and you've fooled me! 8-)

Obviously, a single pixel is going to be a LOT harder to distinguish
than a block of say 50*50 or some such thing.

I'd be more than happy with the Falcons 65000+ colors, that'd be more
than enough for most purposes!
(From the pictures I've seen, it looks more than adequate, and that
was only in 256 color mode.... (I think.....)

>annoys me, because it is impossible to have a black background and
>black borders. The closest I came by fiddling with the control panel
>colors was black background, white borders, and white background for
>rooms.

The color support in 3.1.0 is, unfortunately, very buggy. The intent was to have a black background everywhere (with a white border) and for all characters to be white on black. Unfortunately, it seems that in 4 color mode (i.e. ST medium res.) the colors aren't set up properly. It will probably work much better for you in TT medium res. (if you have that) or in ST low res (which, unfortunately, also has a bug -- some spurious warnings appear about the terminal not being big enough. If you ignore these the game should play correctly).

These problems should be fixed in 3.1.1, i.e. the first patchlevel to NetHack. In the meantime, you can avoid color strangeness by putting "nocolor" in your nethack.cnf file.

Incidentally, several people have asked me why the color behaviour was changed from NetHack 3.0, which used to invert the meaning of black and white and which set up the 4 color palette and mixed colors to produce more effects. The answer is one word: "multitasking". It's very impolite for a program to change the color palette, especially a text based program that doesn't really need to do so. Besides, more and more people have TTs and Falcons, which are capable of displaying all 16 colors simultaneously without any color palette changes being necessary. (Another reason to upgrade to the Falcon: so you can run NetHack with more colors :-)). So NetHack 3.1 leaves the palette alone, and achieves the "white on black" effect by sending the VT52 escape codes to set the character output colors (which is why the border remains white; but this method has the advantage of working in a MultiTOS text window). Since the color palette is left alone, only red, green, and white characters are available.

Regards,
Eric

From what I read the Falcon has a 32bit bus , the DMA has 8
independant 16bit busses. That's what Byte mag says anyway.
See ya. Why not cool it on the wars and just enjoy the use of
both equally great machines?!:)

The last time I heard, Atari bumped the MAc off the top at around
39 45 percent useage of Midi equipment. The Amiga was let's say
it was lower than the Commadore 64!

There is no rule that says a word has to be 8,16,32,64,etc bits
in size. I worked on a mainframe that had a word size of 48 bits, and at
the moment there are 2 parallel processor systems in the room next to me,
that use a word size of 4 bits (no typo, I said four bits) per processor
(each machine has 4096 processors).

I'm sorry for reposting this entire message, but I thought it was necessary.
I haven't seen biased mudslinging against the Atari since the early days of the
Atari/Amiga wars. This is pathetic.

Sure does wonders for my opinion of Mac advocates. Anybody else's opinion
similar?

<sigh>

3051. what should I do ???

Newsgroup: comp.sys.atari.st
Date: 1993-02-19 09:21:47 UTC
From: SCUNNANE@ESTEC.BITNET
Message-ID: <93050.092147SCUNNANE@ESTEC.BITNET>
Source record: 209838

I've just been offered an ATARI 1040ST with SM124 monitor for a very reasonable price but my dilemma is should I buy it or should I go for something like a MEGA instead (I am probably going to be running stuff like DOS emulators, Word Processing etc. as well as Music software).

Can anyone give me some advice ?

Thanks.

3052. An embarrassing newbie question

Newsgroup: comp.sys.atari.st
Date: 1993-02-19 09:31:26 UTC
From: dansk@ocf.berkeley.edu
Message-ID: <1m29de$5u2@agate.berkeley.edu>
Source record: 209841

I'm new to the ftp phenomenon, and I wondered if someone around here could tell me where I can find a copy of uudecode for the ST, or if that is the province of the netting computer... or in other words, could someone explain how one gets runnable files on one's ST from encoded ftp files?
This info is greatly appreciated.

>Amiga and Mac 12- and 16-bit high-end sound systems.
^^^^^^^^^

I know that there is a lot of cards you can ADD, but thats's just my point
on the Amiga you MUST ADD cards to match the Falcon specs. Sure there may
be/come cards on the Amiga that can do circles round the Falcon, BUT what
does it cost in additon, what software will use it since it's not standard
and who can afford it. There are even cards on the PC that is better than
the Falcon sound, but it costs money (are you amigans so filty-rich that you
don't care about money. There are cards for the MAC that crushes the
Toaster, so why do people buy an amiga with a toster then, because it's
affordable and much more cost/capability effissent <-is that word right?.
There are cards to match the Falcons specs. to add on every machine well
almost every machine, but it costs extra money. I could buy a card for the
Falcon to match that again and the discussion continues for as long as
there are better cards to add. The price doesn't matter does it?!

I saw an ad for a card in Amiga world yesterday it costs $ 1495 and it does NOT match the Falcons specs. Does this mean that you must pay more than $ 1495 + an Amiga 4000 ec030 to match the Falcon specs. I think the musicians will buy a Falcon any day.

My point is that the Falcon gives you alot in one package for a reasonalbe sum of money. It has got more than good enough specs. for the average musicians. The CODEC is the same as those in the Sony and Philips use. The DSP is more than good enough to do amazing effects (read BYTE, february issue). The Falcon without extra hardware is not meant to be a proffesional studio sampler for big studios like"Virgin" and "Sony music" it's for the average musician/user and to a certain extent small studios that can't afford big and VERY expencive equipment.

If everybody where to think like you who would buy an Amiga? They would buy a Mac and a True 24-bit color card for it, plus a DTV card and a 16-bit sound-card cos the specs. are better than on the Amiga. You see, everybody has that kind of cash on their hands......

Again I tell you just wait and see after the big MIDI messe in Germany before you say anything else I'll bet the response will be enormous.

>I wonder if Amigas will show up running the Sunrize 16-bit cards or
>the One Stop Music Shop (you know, 32 voices of 16-bit sound with hundreds
>of built-in high quality digitized instruments... can your Falcon do that?
>Come to think of it, can you even _get_ a Falcon yet?)

If you live in other countries than the Scandinavian ones I think you could, but what the heck you can't get an A4000 ec030 nor a A1200 here either. The A1200 won't ship here until March. This I know since I work in a shop where we sell amiga and atari. The Falcon will probably arrive shortly after that.

I'm wondering what it is about the subject message that makes it biased
"mudslinging"... did you have some reason to challenge any of
its points as to factual accuracy, or was it just that it
contained information that you'd rather not hear..?

From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1m2csrlNNlkv@golem.wcc.govt.nz>
Source record: 209844

I seem to be having a lot of problems with ZIP files
that have been posted to the Atari directory
at tu-berlin.de...

STZIP21 will not extract them and I have tried the gnu zip 1.03,
so who is posting files that Atari users can't extract..

so far jargon.zip 1stgui_1.zip and 1stgui_2.zip...

To tell me chaps what gives...???

So one thing, lets STOP using this incompatible ZIP right now...!!!!

Roger.............. sheppard_r@kosmos.wcc.govt.nz

3057. CFV: Creation of comp.sys.atari.advocacy

Newsgroup: comp.sys.atari.st
Date: 1993-02-19 11:16:07 UTC
From: dxo@cs.bham.ac.uk
Message-ID: <1993Feb19.111607@cs.bham.ac.uk>
Source record: 209846
Cross-posted to: news.groups,comp.sys.atari.st,comp.sys.atari.st.tech

```
FIRST CALL FOR VOTES
====================

This is a Call for votes on the creation of a newsgroup for
debates about the Atari range of personal computers.

Group Name
==========
comp.sys.atari.advocacy

Status
======
Unmoderated

Rationale
=========
This group will separate a section of discussion, mainly from the current
newsgroup comp.sys.atari.st but also relatted topics including the Atari 8-bit
range of computers (atari.8bit) and the new Atari Falcon computers.

The discussion of advocacy currently takes up over 50% of the items
in the atari.st newsgroup and so it is felt that the original
purpose of the newsgroup is being left behind.

New users and people who need information about the Atari ST can
continue to use the original group and would hopefully get more
attention if there is less advocacy mail present.

Voting
======
VOTING PERIOD IS:
16th February 1993
to 16th March at 9:00 GMT.

HOW TO VOTE:
1. REPLY to THIS message.

2. send your votes to:
JANET(UK accademics): dxo@uk.ac.bham.cs
INTERNET(all others): dxo@cs.bham.ac.uk%@uknet.ac.uk

WHAT YOUR MAIL MESSAGE SHOULD CONTAIN:

For a yes vote:
---------------------------------------------------------------
I vote "Yes" for the creation of "comp.sys.atari.advoacy"
VOTE: [lastname], [firstname] [email address] : YES
```

.

For a no vote:

I vote "No" for the creation of "comp.sys.atari.advoacy"
VOTE: [lastname], [firstname] [email address] : NO
.

Rules on voting
===============

Voting Rules:
-Only one vote per user (Two different people cannot vote under the
same user name).
-Any votes which are received before or after the voting period
will be discarded.
-Any vote which does follow the above examples specifically,
will not be valid.
-Anyone who wants to change their previous vote may do so by voting
again. They must indicate that they have previously voted and are
changing their mind in a footnote. A changed vote will discard your
previous vote.

Ambiguous Votes:
Ambiguous votes -- those who do not follow the specified format, or
do not make clear the voter's intent, will, where possible, be
returned to their senders for clarification. Ambiguous votes which
cannot be returned to their senders or for which no clarification is
provided will be identified in vote mass acknowledgements and in the
final vote tally.

******* ANY PROBLEMS, MAIL THE ADDRESSES ABOVE! *********

3058. F030 - STE Sound Compatibility

Newsgroup: comp.sys.atari.st
Date: 1993-02-19 11:21:12 UTC
From: Craig.Graham@newcastle.ac.uk

I have just got the STE-Sound device driver for the Falcon from germany, and this definitely improves compatibility with STE software (all the MOD players & stuff from the STE that I've tried with it now work (they just killed the computer before). This is only a 6K auto program as well :)

3059. C64 Emulator for ST?

Newsgroup: comp.sys.atari.st
Date: 1993-02-19 11:31:57 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Feb19.113157.3776@dct.ac.uk>
Source record: 209848

Hi!

I've been after a decent C64 emulator for ages now, and recently got hold
of one. Unfortunately it was with complete german docs and was very limited.
A friend told me that he had seen a newer version of it with english docs.

Does anyone know of this? Do you know where I could obtain a copy of it?

I own a 64 as well as my 1040STE, and like to use both frequently, but I find
it an interesting concept to mess with, as well as use.

I can only really code in 6510 (64), as I haven't really got round to 68000.
I'm hoping that the new emulator (if it exists) will be more flexible, though
I'm hardly expecting it to be able to run C64 demos and such like.
(The ST's sound-chip couldn't cope with the power of SID!)

Thanks in advance for any help given!

Feekzoid

This :ukus problem has been the cause of many a cross-pond computer error.
Most common is when a UK or US specific programming language is released with
"COLOR" or "COLOUR" as a command; at one side of the Atlantic or another,
there is going to be a problem (eg. STOS has the command COLOUR).

Anyway, how do Yanks tell the difference between "Collar" (as in shirt)
and "Color" (as in Colour spelt Yanklish-style)? Surely they are pronounced
the same? (Rhetorical question: answers to my mailbox not this group).

>Can some one check it out for me and let me know...??

I got my copy yesterday and had no problems. How much memory have
you installed? Maybe the file JARGON.SRC, which is 1.3 MB big,
can`t be extracted with 1 MB RAM. (I have 3 MB)

Our on-line Oxford English dictionary sez, in the entry for colour,
that "colour" has been the normal English spelling since the 14th
century, but "color" has been in use also since the 15th century.

>only *just* works in 1meg. (Mine crashes when I hit 'Load file',
>that's with NO TSRs, or DA's, 1meg, TOS 1.2)

I definitely agree that on a stock ST/e that Photochrome is the
way to go for viewing GIF's (sure wish he'd add JPG support, though
that would probably need to have even more memory available).

One trick you could use when messing with Gemview is to boot up
with DOUBLE2 (in interlaced mode) in LOW RES - that would effectively
give you 320x400x16, which is not too terrible for viewing GIF's
(and the best way at the moment to view JPGs without having to
convert them to GIF first).

As for memory - I wanted to view a 1500x1000x256 GIF - I needed to
have *3* megs available to view it under Gemview (luckily I have
4 megs ram). The reason Gemview uses more memory is because it fits
the ENTIRE picture within a (scrollable) window, thus it needs memory
for every pixel. Photochrome converts everything to 320x200x?????
and thus only has 320x200 pixels to worry about...

Bob, try B&C Computervisions (408-986-9960) in Santa Clara, California.
They advertise most 8bit carts for $9.95 and also deal in 8bit computers
and parts for same. You might also try BRE Software (800-347-6760).

:
: PS I will be writing games for the Falcon :)

I only yesterday telephoned The First Computer Centre in Leeds asking about Falcons and they inform me that Atari UK has officially given a release date for Falcons. Not mid-March, not next Easter, not this Autumn, but an actual date. What is the date? Well according to them it is;

THE 1st OF MARCH.

Hooray. Let's hope they stick to it this time.

Not to worry, NeXT will be concentrating on software, such as their NeXTSTEP package. It provides a wonderfully useful GUI with Display Postscript, builtin multimedia support, multi-platform networking, object oriented architecture, etc. Besides NeXT computers, NeXTSTEP can also run on pc's. But check out their _minimum_ recommended system requirements:

486SX or DX (DX2 recommended)
120Mb available hard disk space (for s/w development, recommend 330Mb)
^^^ That's the available space, not the size of the entire hard disk!
8Mb minimum RAM, 12Mb recommended for grayscale support
16Mb minimum RAM, 24Mb recommended for 16bit color support
LocalBus or VL Bus graphics adapter required

Again, keep in mind these are their recommended MINIMUM requirements and in my experience, "minimum requirements" translates to barely useful! Wowza!
